# Overview of SUSY results from the ATLAS experiment

Jamie Boyd (CERN)

On behalf of the ATLAS Collaboration

- Introduction to SUSY searches in ATLAS
- Search results
  - Inclusive searches for strong production
  - 3<sup>rd</sup> generation searches
  - Electroweak production
  - R-Parity violation and long-lived searches

} Natural SUSY!

Try to give an comprehensive overview of the ATLAS SUSY programme.  
Not an easy task in 40mins! Will have to go (very) fast in some places.  
(More details on new results in parallel talks!)

# The ATLAS detector

Designed for (amongst other things) detection of SUSY decays => excellent performance for electrons, muons, taus, photons, (b-)jets & MET. Superb detector performance in Run-1.

# 2012 ATLAS dataset - 20/fb of 8 TeV data

The price to pay for so much luminosity is pileup. Average pileup in 2012 ~20 interactions per bunch crossing. A huge amount of work undertaken to achieve excellent physics performance in these challenging conditions.

# How do we search for SUSY at the LHC

SUSY (more than) duplicates spectrum of particle states wrt. Standard Model

Sparticles decay in ( $b/c$ -)jets, leptons, taus, photons, invisible (MET), ...

$R$ -parity conserving (RPC) signatures:

- Sparticles produced in pairs, each decays to (WIMP) LSP, mostly lightest neutralino or gravitino
- One invisible LSP per decay chain  $\rightarrow$  MET

$R$ -parity violating (RPV) signatures:

- Resonances or multijets / multileptons: single sparticle production or LSP decay
- Displaced vertices from late LSP decay

Long-lived particles from:

- Weak couplings (eg, RPV, gravitino)
- High virtuality from heavy mediator sparticles (eg, heavy squarks in split SUSY)
- Mass degeneracy (eg,  $m(\text{chargino}) \sim m(\text{LSP})$  in AMSB)

# Where do we start?

Huge parameter space, but guiding principles

SUSY searches strategy driven by cross section and luminosity

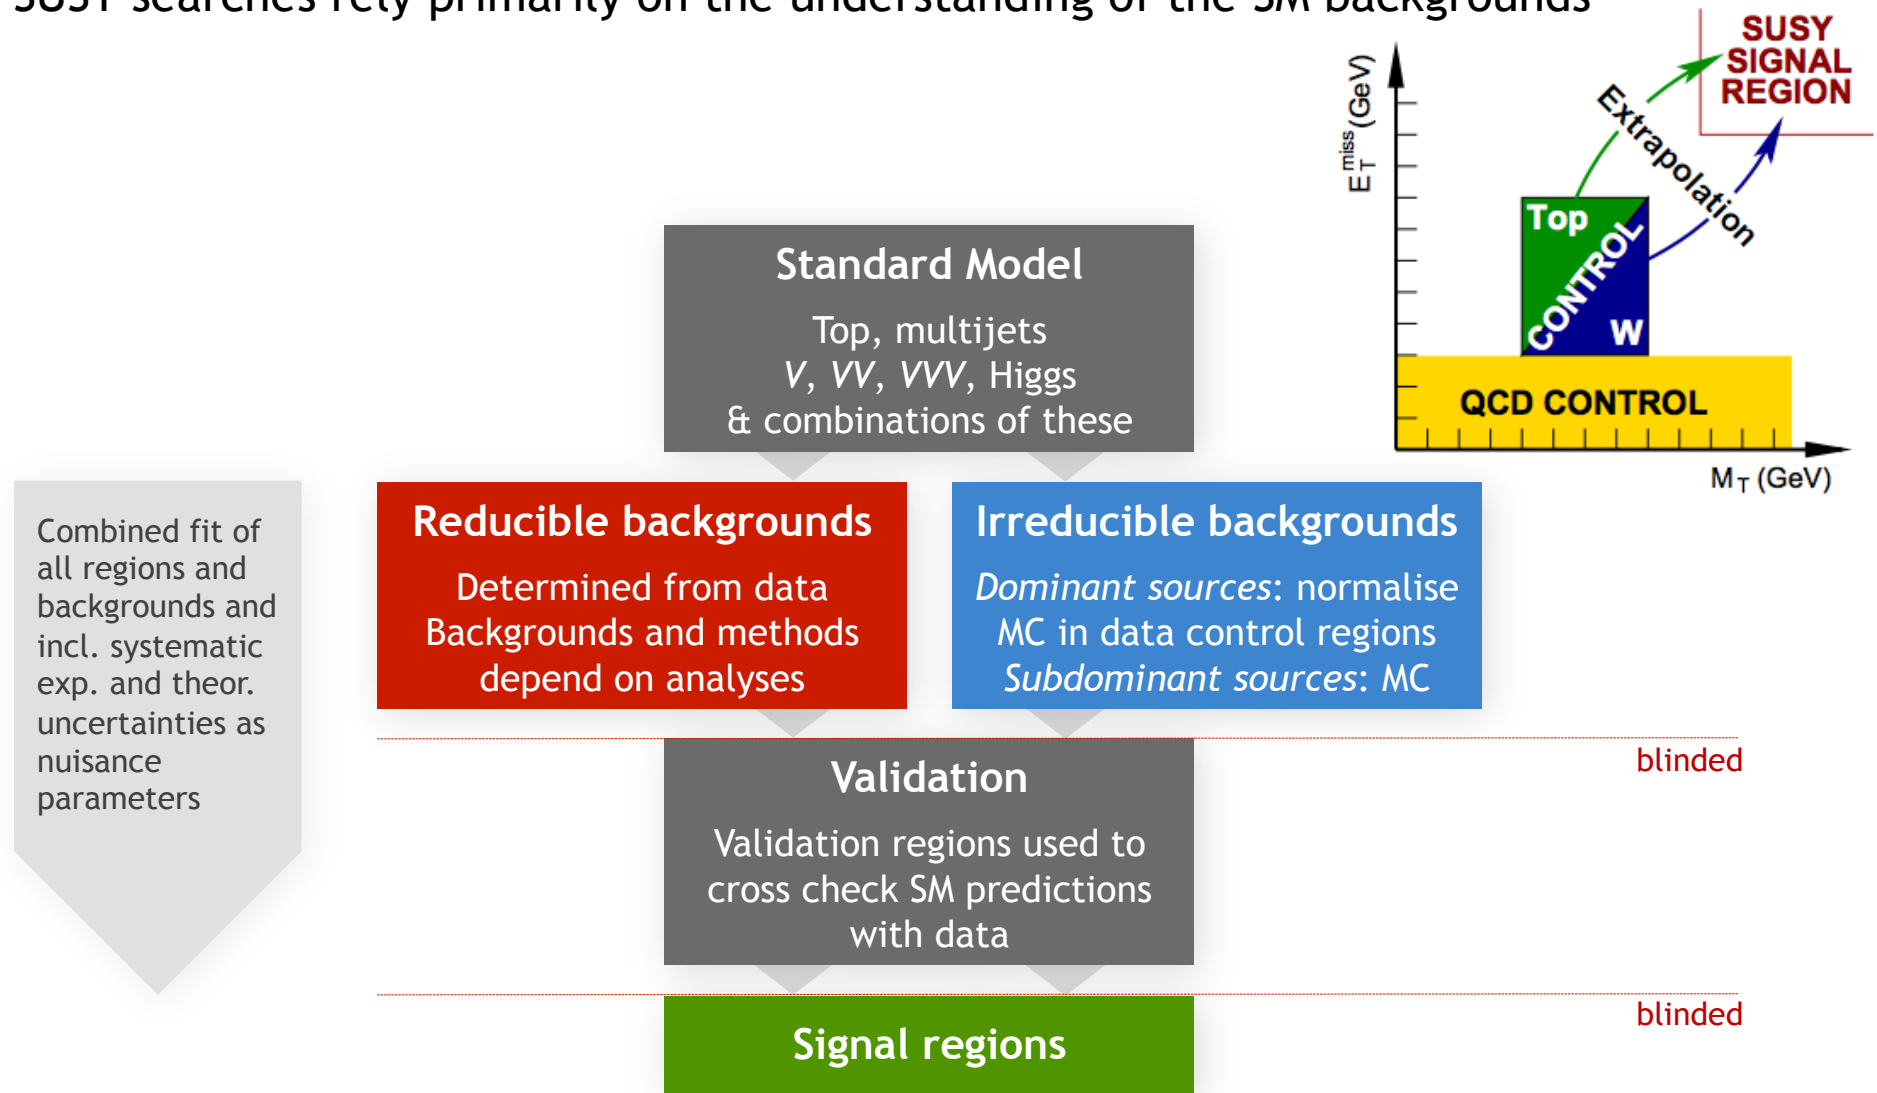

Early analyses dominated by broad and inclusive searches for gluino and squark production, but right from the start also addressed experimentally challenging searches such as for long-lived particles and RPV

Increasing luminosity gave access to rarer production channels. Additional motivation from *Natural SUSY* paradigm

It was quickly realised that dedicated searches had to be developed to adequately cover the rich decay spectrum

# How do we search for SUSY ?

SUSY searches rely primarily on the understanding of the SM backgrounds

# SM “backgrounds” – the big picture

SM processes well understood over many orders of magnitude production rate

ATLAS 1304.7098

No hints for new physics

# SM “backgrounds” – the big picture

SM processes well understood over many orders of magnitude production rate

ATLAS 1304.7098

Main bkg:  
 W/Z+Jets,  
 top pairs,  
 di-bosons

A comprehensive set of unfolded differential measurements carried out on these processes with the 7 TeV data => input to bkg estimates

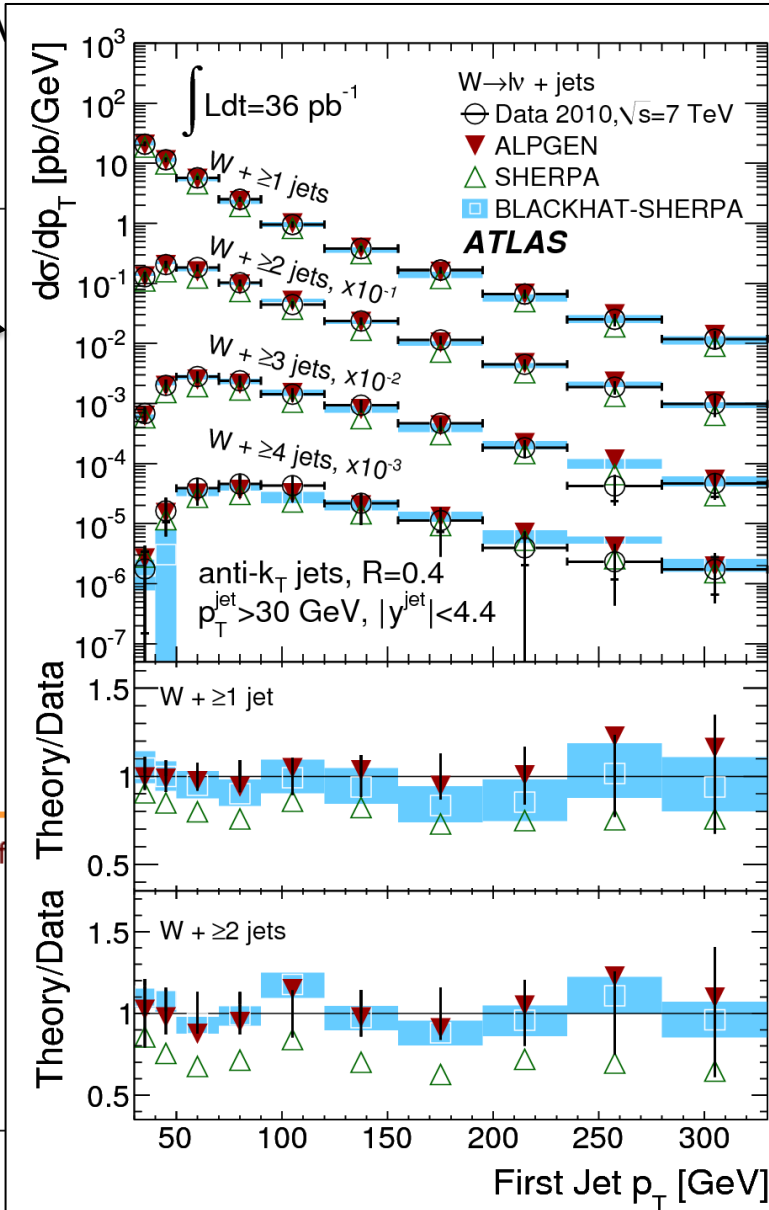

In future will use these to tune MCs.

In general MCs do a fair-good job of describing the data.

# SM “backgrounds” – the big picture

SM processes well understood over

production rate

# Separating SM background from SUSY signal events

## Kinematic and topological variables in SUSY searches

$m_{T2}$  distribution in dilepton stop search; endpoint at  $W$  mass for  $t\bar{t}$  events

$$m_{T2} = \min_{\mathbf{q}_T} \left[ \max \left( m_T(\mathbf{p}_T^{\ell 1}, \mathbf{q}_T), m_T(\mathbf{p}_T^{\ell 2}, \mathbf{p}_T^{\text{miss}} - \mathbf{q}_T) \right) \right]$$

$m_{\text{eff}}$  distribution in 0-lepton + 3=jet + MET analysis

Numerous variables developed to exploit kinematic information in events with two massive invisible particles for SUSY spectroscopy in case of discovery

Turned out to be also useful for SUSY vs. SM discrimination

Long list:  $p_T(\text{jets/leptons})$ ,  $N_{\text{jets}}$ ,  $\Delta\phi$ ,  $E_T^{\text{miss}}$ ,  $H_T$ ,  $m_{\text{eff}}$ ,  $m_T$ ,  $m_{T2}$ ,  $m_{\text{CT}}$ , Razor variables ( $M_R$ ,  $R$ ), MVA, ...

Optimal working point can be achieved in many and often fairly equivalent ways

$$m_{\text{eff}} \equiv \sum_{i=1}^n |\mathbf{p}_T^{(i)}| + E_T^{\text{miss}}$$

# Identifying a signal / constraining SUSY parameters

Combined fits of control regions (CRs) and signal regions (SRs) fixes background prediction

Results of searches presented in form of raw numbers and (so far only) limits

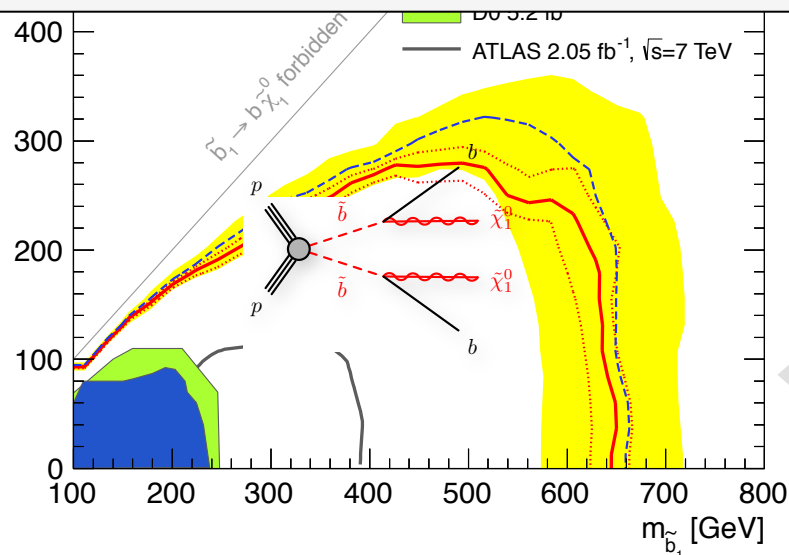

- Raw results presented as number of observed and expected events and uncertainty for each signal region
- $P$ -value for background-only hypothesis
- No signal  $\rightarrow$  95% CL limit on  $N_{\text{events}}$  (BSM)
- Test SUSY models
  - Constrained models (eg, mSUGRA/CMSSM, GMSB, pMSSM, ...)
  - Simplified models
- Model-dependent 95% CL limits:
  - **Observed** and **expected** limits with theoretical and experimental uncertainties, respectively

# Identifying a signal / constraining SUSY parameters

Combined fits of control regions (CRs) and signal regions (SRs) fixes background prediction

- Often many SRs per analysis optimized to give good sensitivity over large range of parameter space
  - Choose SR with best expected limit for given signal model point
- Deliberately try to make SRs (and CRs) orthogonal to allow combination of searches
- CRs chosen to minimize signal contamination (taken into account in exclusion results)
- Some analyses sensitive to different SUSY models - can be re-interpreted in different scenarios
- Try to give as much information as possible in our public results to allow new interpretations of the results in different models

- Test SUSY models
  - Constrained models (eg, mSUGRA/CMSSM, GMSB, pMSSM, ...)
  - Simplified models
- Model-dependent 95% CL limits:
  - **Observed** and **expected** limits with theoretical and experimental uncertainties, respectively

# Overview of ATLAS SUSY analyses

## Inclusive squark/gluino

0-lepton + 2-6 jets + MET  
0-lepton + 7-10 jets + MET Sig.  
1-2 leptons + jets + MET  
2-lepton + jets + MET \*

\* = new for this conference 18

# Inclusive searches for squark and gluino production

Extensive “jets + X +  $E_T^{\text{miss}}$ ” programme: 0-leptons + 2-6 jets + MET

Most recent ATLAS reference (8 TeV): ATLAS-CONF-2013-047

- Very powerful inclusive search
- MET + jet trigger
- $M_{\text{eff}}$  main discriminating variable
- Up to 3 SRs for each jet multiplicity
- Backgrounds taken from dedicated data CRs

$$m_{\text{eff}} \equiv \sum_{i=1}^n |\mathbf{p}_T^{(i)}| + E_T^{\text{miss}}$$

More details in talk by M Hohlfeld

# Inclusive searches for squark and gluino production

Extensive “jets + X +  $E_T^{\text{miss}}$ ” programme: 0-lepton + 7-10 jets + MET significance

Most recent ATLAS reference (8 TeV): 1308.1841

- Powerful for gluino pair production with many jets
- Complementary to 2-6 jets analysis, uses jet only trigger allows lower MET cut ( $\sim 50\text{GeV}$ )
- Data driven multi-jet background method (MET significance independent of jet multiplicity)
- Jet  $p_T > 50$  (80) GeV, MET sig.  $> 4 \text{ GeV}^{1/2}$
- SRs w/wo b-tags and w/wo fat jets

$$\text{MET sig.} = E_T^{\text{miss}} / \sqrt{H_T}$$

Fat jet variable:

$$M_J^\Sigma \equiv \sum_j m_j^{R=1.0}$$

More details in talk by M Hohlfeld

# Inclusive searches for squark and gluino production

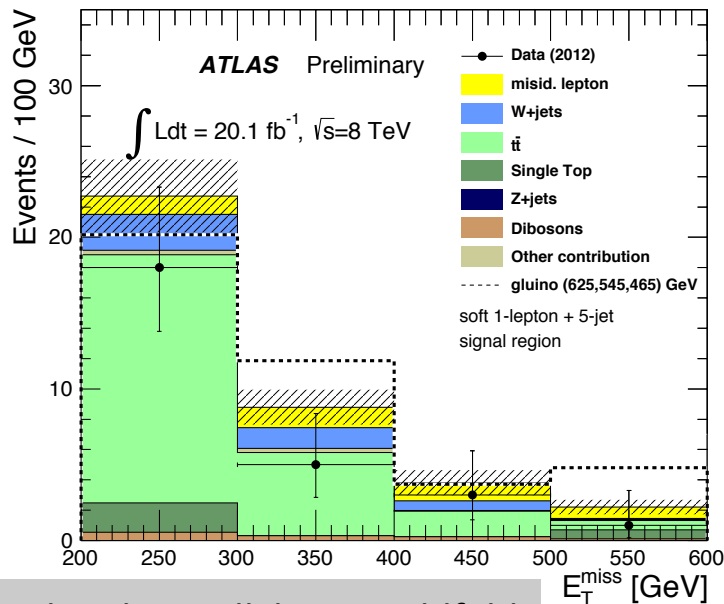

Extensive “jets + X +  $E_T^{\text{miss}}$ ” programme: 1-2-leptons + jets + MET

Most recent ATLAS reference (8 TeV): ATLAS-CONF-2013-062

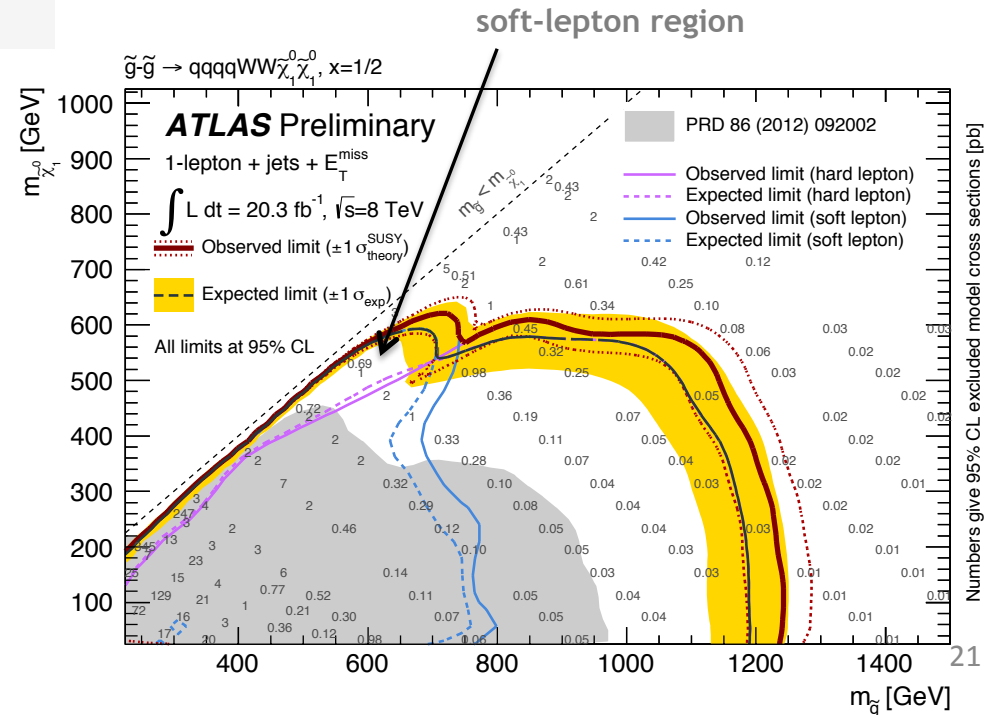

- Single lepton or MET trigger
- $M_T$  used to reduce background from W+jets and top
- Hard lepton analyses ( $p_T > 25\text{GeV}$ ) complemented with soft-lepton ( $p_T > 10[e], 6[\mu]\text{GeV}$ ) for compressed spectra
- SRs with 3,5,6 jets and various MET,  $M_{\text{eff}}$  cuts

$$m_T = \sqrt{2p_T^\ell E_T^{\text{miss}}(1 - \cos(\Delta\phi(\ell, \mathbf{p}_T^{\text{miss}})))}$$

More details in talk by M Hohlfeld

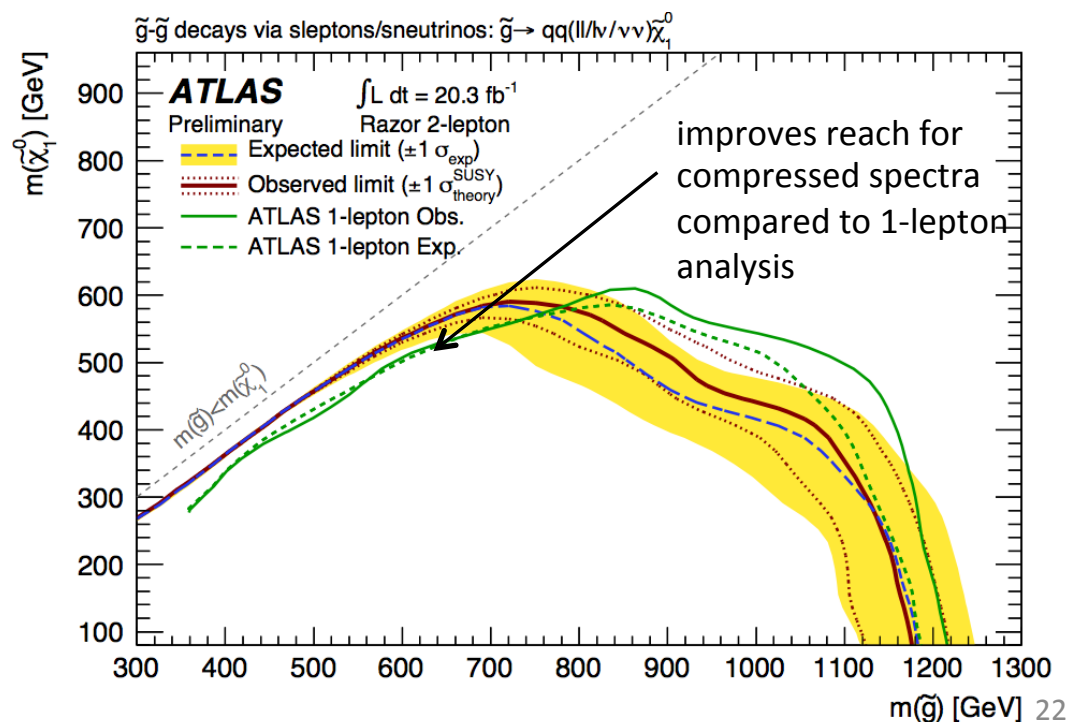

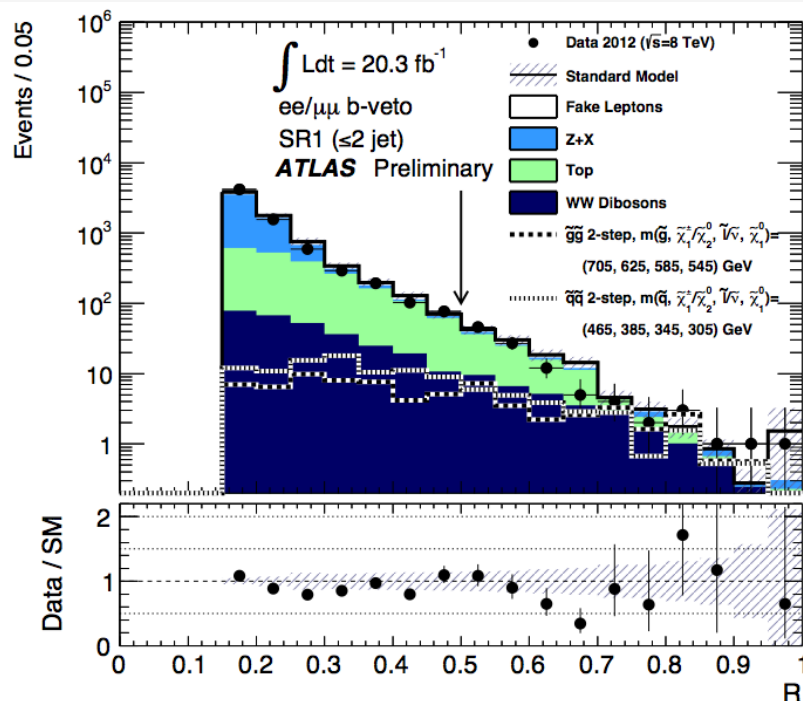

New for this conference!

# Inclusive searches for squark and gluino production

Extensive “jets + X +  $E_T^{\text{miss}}$ ” programme: 2-leptons + jets + MET

Most recent ATLAS reference (8 TeV): ATLAS-CONF-2013-089

- Analysis uses Razor variables to distinguish signal from bkg
- Uses di-lepton trigger,  $p_T$  down to 8[ $\mu$ ], 14[e] GeV
- Z-veto applied
- SRs with different jet and Razor requirements

More details in talk by M Hohlfeld

# Inclusive searches for squark and gluino production

Extensive “jets + X +  $E_T^{\text{miss}}$ ” programme with neutralino LSP

MSUGRA/CMSSM:  $\tan(\beta) = 30, A_0 = -2m_0, \mu > 0$

Status: SUSY 2013

This specific CMSSM grid is designed to have better compatibility with observed heavy Higgs, and for low fine tuning. Dominant process gluino mediated stop.

More details in talk by M Hohlfeld

# Inclusive searches for squark and gluino production

GMSB models can lead to enhanced tau production: 1-2 taus + jets + MET

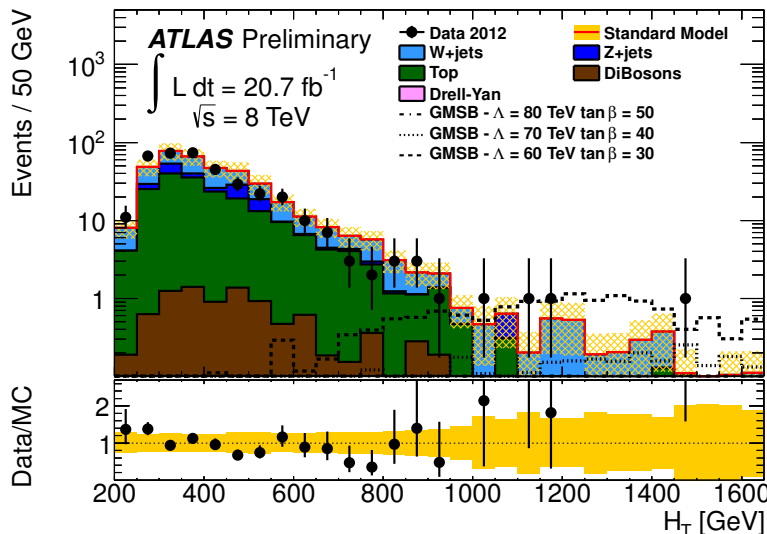

Most recent ATLAS reference (8 TeV): ATLAS-CONF-2013-026

- 1, 2 hadronically decaying taus ( $p_T > 20$  or 30 GeV), 2-4 jets
- Separate SRs for GMSB and natural Gauge Mediation (nGM) scenarios
- Larger fake background for hadronic taus. However multijet background negligible after MET cut ( $> 130$  GeV)

In nGM model:

$$m(\tilde{g}) > \begin{cases} 1.2_{\text{low-}\tan\beta} \\ 1.5_{\text{large-}\tan\beta} \end{cases} \text{ TeV}$$

More details in talk by M Tripania

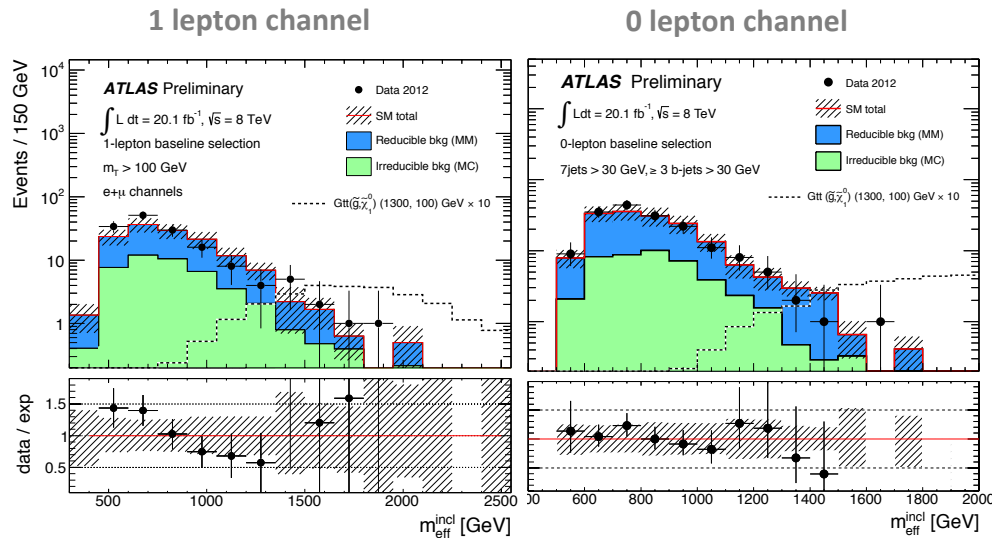

# Searches for “Natural” SUSY scenarios

Glauino-mediated stop / sbottom production:  $\geq 3$  b-jets + 0-1 leptons + MET

Most recent ATLAS references (8 TeV): ATLAS-CONF-2012-061

- Most powerful search for high gluino mass
- Jet + MET trigger
- Reducible bkg ( $t\bar{t}$ +fake b's) from matrix method
- Irreducible bkg ( $t\bar{t}+b\bar{b}$ ,  $t\bar{t}V$ ) from MC
- Also powerful for direct sbottom search

More details in talk by M Barisonzi

# Searches for “Natural” SUSY scenarios

## Glauino-mediated stop / sbottom production

Most recent ATLAS references (8 TeV): ATLAS-CONF-2013-061, ATLAS-CONF-2013-007, ATLAS-CONF-2012-151

- 2 same-sign leptons + (0,1,3) b-jets + MET
- Broad analysis: good sensitivity in many models including strong production and direct sbottom
- 0-leptons + 7-10 jets + MET Significance (already discussed)
- 3-leptons + jets + MET

More details in talk by M Barisonzi

# Searches for “Natural” SUSY scenarios

## Summary of gluino-mediated stop production

More details in talk by M Barisonzi

# Searches for “Natural” SUSY scenarios

## Direct stop / sbottom pair production

Most recent ATLAS references (8 TeV): 1308.2631, ATLAS-CONF-2013-024, ATLAS-CONF-2013-037, ATLAS-CONF-2013-048, ATLAS-CONF-065, ATLAS-CONF-2013-068, ATLAS-CONF-2013-025

Large spectrum of possible stop/sbottom decays. Effort so far concentrated on simplified models with 100% BRs to chosen final state. Studies of handedness dependence performed.

Dedicated effort to search for direct stop / sbottom production

sbottom decays searched for:

$$\tilde{b}_1 \rightarrow b \tilde{\chi}_1^0$$

$$\tilde{b}_1 \rightarrow t \tilde{\chi}_1^\pm$$

$$\tilde{b}_1 \rightarrow b \tilde{\chi}_2^0 \rightarrow b h(Z) \tilde{\chi}_1^0$$

More details in talk by P Jackson

# Searches for “Natural” SUSY scenarios

Direct sbottom / stop pair production:  $2b + \text{MET}$

Most recent ATLAS references (8 TeV): 1308.2631

-Sensitive to direct sbottom production and direct stop where  $\tilde{t} \rightarrow b C_1 \rightarrow b W N_1$  with small mass splitting between  $C_1$  and  $N_1$  (virtual W with soft decay products)

More direct sbottom results in backup

- Use  $m_{CT}$  variable to reduce background from top pairs
- Remaining background dominated by  $Z(\nu\nu) + bb$
- SR with ISR jet to help with compressed scenario

More details in talk by P Jackson

$$m_{CT}^2(v_1, v_2) = [E_T(v_1) + E_T(v_2)]^2 - [\mathbf{p}_T(v_1) - \mathbf{p}_T(v_2)]^2$$

# Searches for “Natural” SUSY scenarios

Direct stop pair production: 0-lepton + 2b + 6 jets + MET

Most recent ATLAS references (8 TeV): ATLAS-CONF-2013-024

- Direct stop production  $\tilde{t}\tilde{t}^* \rightarrow t N_1$  (0-lepton) final state like  $t\bar{t}$ +MET
- Largest background from semi-leptonic top, mitigate by fully reconstructing hadronic top system
- Also utilize  $m_T(b, \text{MET})$  as key discriminating variable

- 3 SRs (different MET cuts) targeting medium and heavy stops
- Insensitive to top polarization
- Also present results as BR limit
  - what  $\text{BF}(\tilde{t}\tilde{t}^* \rightarrow t N_1)$  would still be excluded?

More details in talk by P Jackson

# Searches for “Natural” SUSY scenarios

- MVA (BDT) analysis targeting  $\tilde{t} \rightarrow tN_1$

More details in talk by P Jackson

# Searches for “Natural” SUSY scenarios

## Direct stop pair production: charm analysis

Most recent ATLAS references (8 TeV): ATLAS-CONF-2013-068

- When  $\tilde{t} \rightarrow t N_1 / \tilde{t} \rightarrow b C_1$  are not accessible  $\tilde{t} \rightarrow c N_1$  becomes possible
- First LHC analysis addressing this difficult hierarchy
- 2 SRs with hard ISR jet to trigger, with/without explicit charm tag
- First LHC SUSY search with charm tagging!  
(calibrated on data  $D^*$  sample)

More details in talk by P Jackson

# Searches for “Natural” SUSY scenarios

Direct stop pair production: Z(ll) + b-jets + MET

Most recent ATLAS references (8 TeV): ATLAS-CONF-2013-025

- $\tilde{t}_2$  production important when  $m(t)+m(N_1)\sim m(\tilde{t}_1)$  (as then  $\tilde{t}_1$  difficult to observe)

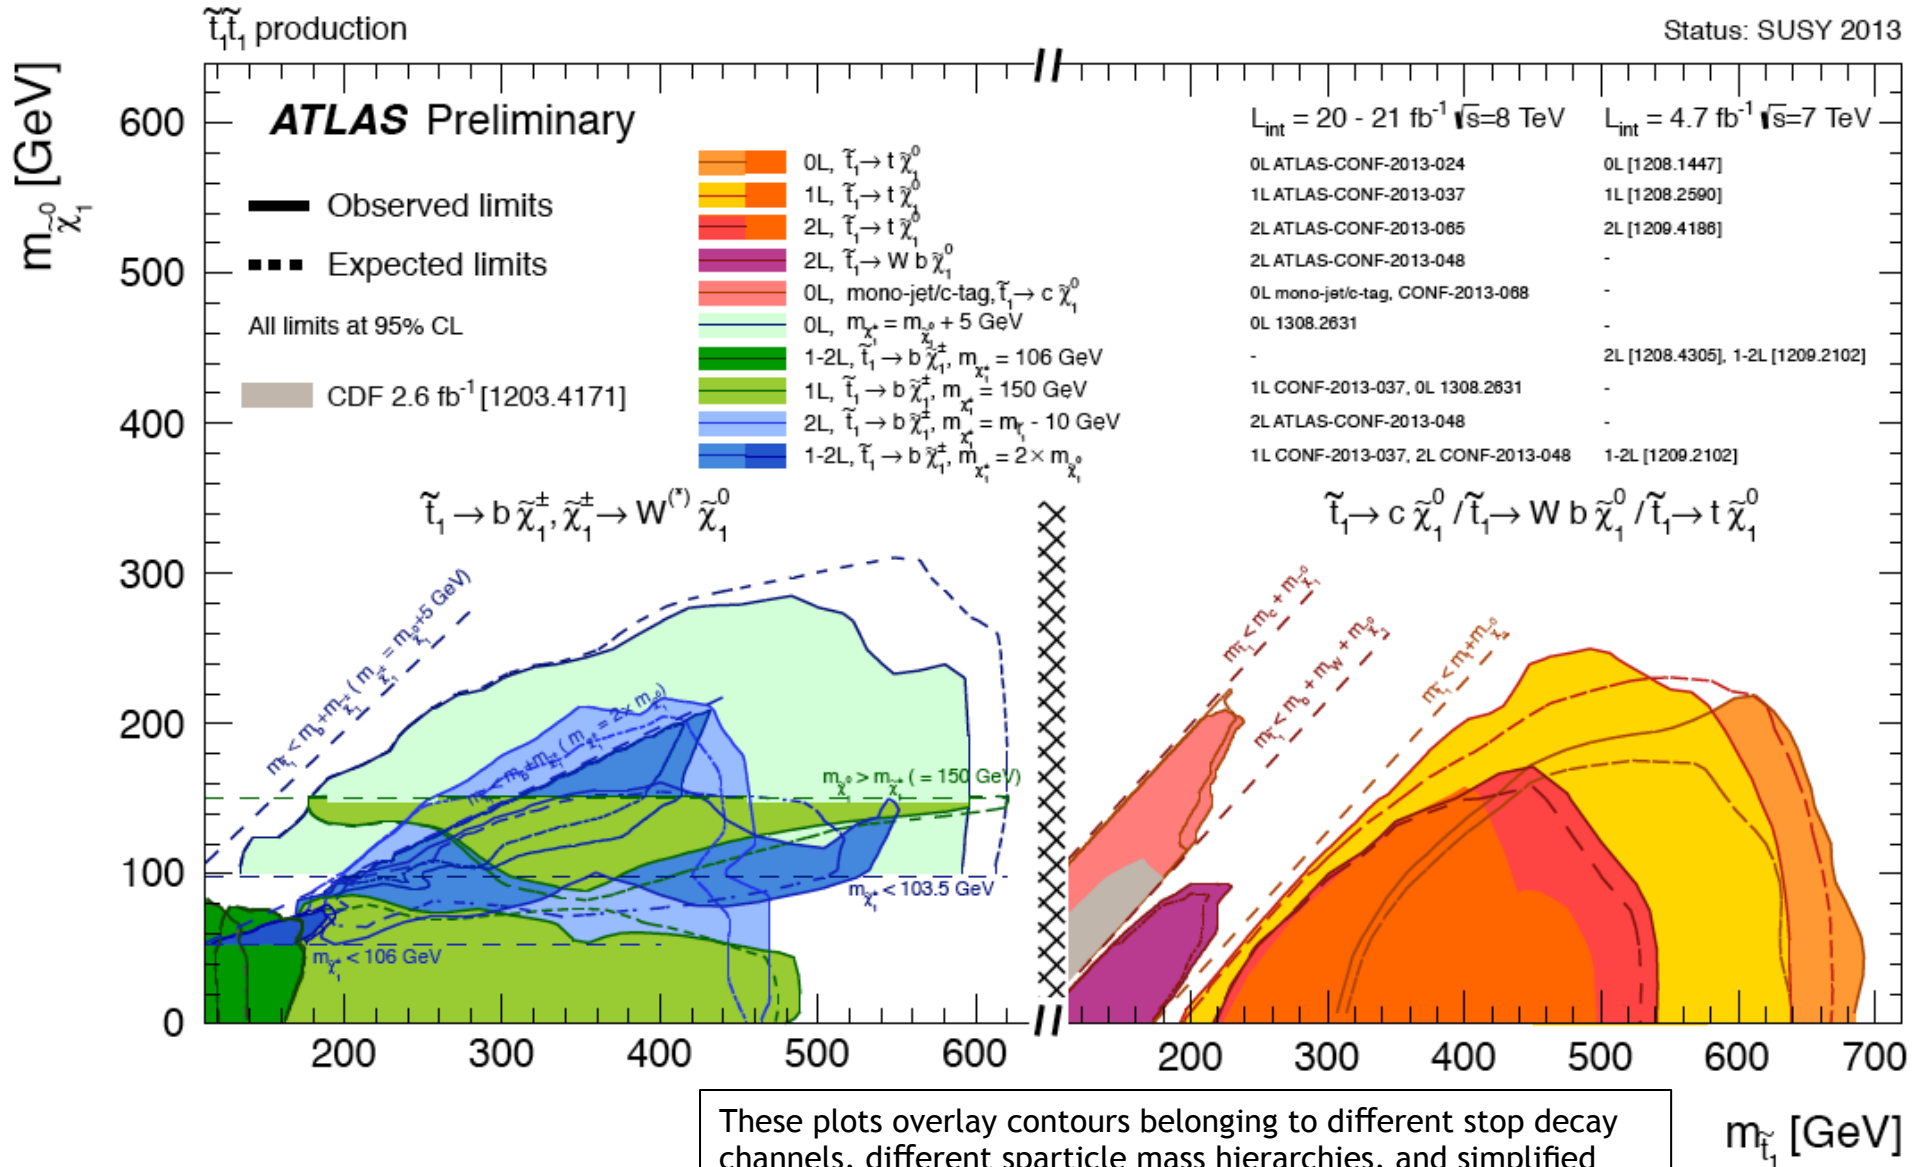

-Interpretation in GMSB and for  $\tilde{t}_2$  decays

More details in talk by P Jackson

# Searches for “Natural” SUSY scenarios

## Direct stop pair production - summary

More details in talk by P Jackson

These plots overlay contours belonging to different stop decay channels, different sparticle mass hierarchies, and simplified decay scenarios. Care must be taken when interpreting them.

$m_{\tilde{t}_1}$  [GeV]

# Searches for “Natural” SUSY scenarios

Electroweak neutralino & chargino and, possibly, slepton pair production

Most recent ATLAS references (8 TeV): ATLAS-CONF-2013-049, ATLAS-CONF-2013-036, ATLAS-CONF-2013-035, ATLAS-CONF-2013-028

Electroweak SUSY particle production occurs through intermediate  $W$  and Drell-Yan processes  
 Search strategy depends on slepton masses and gauge mixture: 2/3/4 leptons + MET searches

Largest cross section for wino-like  $\tilde{\chi}'_1$ 's. Smaller if higgsino (then also mass-degenerate with LSP)

3-lepton final state if light sleptons

Larger cross section for slepton-left

2L + MET final state

If sleptons heavy, reduced branching ratio to leptons

Equivalent picture for chargino pair production: no-slepton case produces  $WW + MET$  final state

Plausible possibility for light  $\tilde{\tau}_1$ , while other sleptons heavy

Characteristic multi-lepton signatures with low hadronic activity: low SM BG

# Searches for “Natural” SUSY scenarios

Direct slepton pair production: 2-lepton + 0-jets + MET

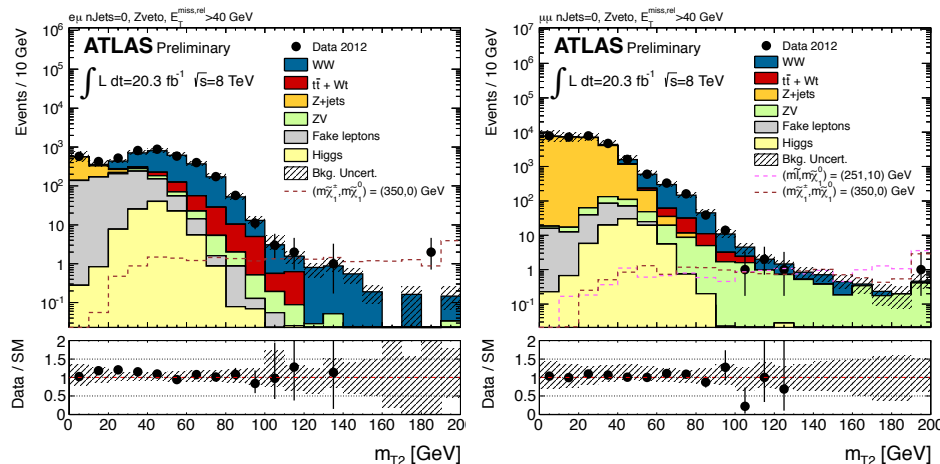

Most recent ATLAS references (8 TeV): ATLAS-CONF-2013-049

- Separation with  $m_{T2}$  & MET
- Jet veto to reduce top bkg
- Dominant bkg from di-boson events
  - large theory uncertainty from di-boson (Powheg MC)

Different flavour

Same flavour

2 leptons (e/mu) + MET search

Different-flavour and same-flavour opposite charge generalised transverse mass distributions

Exclusion limits for slepton-left (top) and slepton-right (bottom)

~2.5 times smaller cross section for slepton-right

First limits on slepton-right production-only from LHC

More details in talk by C Potter

$$m_{T2} = \min_{\mathbf{q}_T} \left[ \max \left( m_T(\mathbf{p}_T^{\ell 1}, \mathbf{q}_T), m_T(\mathbf{p}_T^{\ell 2}, \mathbf{p}_T^{\text{miss}} - \mathbf{q}_T) \right) \right] \quad 41$$

# Searches for “Natural” SUSY scenarios

Direct slepton pair production: 2-lepton + 0-jets + MET

Chargino production with light sleptons?

Exclusion limits for slepton-left (top) and slepton-right (bottom)

~2.5 times smaller cross section for slepton-right

First limits on slepton-right production-only from LHC

More details in talk by C Potter

$$m_{T2} = \min_{\mathbf{q}_T} \left[ \max \left( m_T(\mathbf{p}_T^{\ell 1}, \mathbf{q}_T), m_T(\mathbf{p}_T^{\ell 2}, \mathbf{p}_T^{\text{miss}} - \mathbf{q}_T) \right) \right] \quad 42$$

# Searches for “Natural” SUSY scenarios

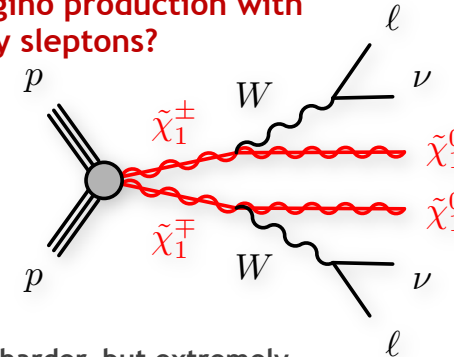

Direct slepton pair production: 2-lepton + 0-jets + MET

Chargino production with light sleptons?

Chargino production with heavy sleptons?

Much harder, but extremely interesting scenario - barely sensitive

More details in talk by C Potter

$$m_{T2} = \min_{\mathbf{q}_T} \left[ \max \left( m_T(\mathbf{p}_T^{\ell 1}, \mathbf{q}_T), m_T(\mathbf{p}_T^{\ell 2}, \mathbf{p}_T^{\text{miss}} - \mathbf{q}_T) \right) \right]$$

# Searches for “Natural” SUSY scenarios

Electroweak production of SUSY: 3-lepton + 0 b-jets + MET

Most recent ATLAS references (8 TeV): ATLAS-CONF-2013-035

- b-jet veto to reject top
- 6 SRs targeting  $C_1N_2$  production (including Z enriched/depleted)
- Main background WZ

More details in talk by C Potter

# Searches for “Natural” SUSY scenarios

Electroweak production of SUSY: 3-lepton + 0 b-jets + MET

Most recent ATLAS references (8 TeV): ATLAS-CONF-2013-035

## Electroweak production of SUSY: 2-taus + 0-jets + MET

Most recent ATLAS references (8 TeV): ATLAS-CONF2013-028

- Target chargino pair production with light staus
- 2 SRs with opposite sign hadronic taus
- $m_{T2}$  key variable
- Bkg dominated by fake taus (multijet)

More details in talk by C Potter

New for this conference!

# Searches for “Natural” SUSY scenarios

Electroweak production of SUSY: 1 lepton + bb + MET

Most recent ATLAS references (8 TeV): ATLAS-CONF-2013-093

- Scenarios where  $N_2$  dominantly decays to Higgs have not been covered by ATLAS searches so far
- New analysis to address this
- bb from Higgs (first analysis to try to reconstruct a Higgs decay!)

- Very difficult due to huge background from top
- $m_{CT}$  variable used to suppress top,  $m_T$  used to suppress W+jets
- Small parameter space exclusion

final result  
 extracted by  
 fit to  $m_{bb}$

More details in talk by C Potter

# Searches for “Natural” SUSY scenarios

## Electroweak production of SUSY Summary

ATLAS Preliminary  $L_{int} = 20.3-20.7 \text{ fb}^{-1}$ ,  $\sqrt{s}=8 \text{ TeV}$  Status: SUSY 2013

Also have a 4-lepton analysis targeting  $N_{2/3}$  decays via sleptons - see backup for details

More details in talk by C Potter

New for this conference!

# RP violation and long-lived particles

RPV decays giving large jet multiplicity

Most recent ATLAS reference (8 TeV): ATLAS-CONF-2013-091

RPV coupling can allow LSP to decay to 3 quarks => many jets in final state

Analysis carried out for  $\geq 6$  and  $\geq 7$  jet signal regions with and without b-jet requirements

Background normalized to data in lower jet multiplicity CRs and extrapolated to SR with MC

Systematic uncertainties measured in data using multiple validation regions

More details in talk by N Barlow

New for this conference!

# RP violation and long-lived particles

RPV decays giving a displaced vertex

bench mark model

Most recent ATLAS reference (8 TeV): ATLAS-CONF-2013-092

Search for high multiplicity, high mass displaced vertex (with associated high  $p_T$  muon ( $>55$  GeV) - used to trigger). To reduce background from hadronic interactions, vertex required to be in a low density material region of the detector. Radial range covered 0.4-18 cm.

Dedicated re-tracking algorithm used to increase acceptance at high radius.

$0.02 \pm 0.02$  background events expected!

More details in talk by N Taiblum

# RP violation and long-lived particles

## Disappearing track signature in AMSB

Most recent ATLAS references (8 TeV): ATLAS-CONF-2013-069

- AMSB model where chargino nearly degenerate with LSP => can travel measurable distance before decaying to an (undetected) pion
- Search for disappearing charged track in events with high  $p_T$  ISR jet (to trigger)
- Signal extracted by fit to track  $p_T$  spectrum

More details in talk by N Taiblum

# RP violation and long-lived particles

GMSB models (and others) can also lead to massive long-lived particles (LLP)

Most recent ATLAS reference (8 TeV): ATLAS-CONF-2013-058

Massive long-lived particles are searched for by ATLAS via time-of-flight, specific ionization loss, and momentum measurements

Subsystems used: silicon trackers ( $\beta\gamma$ ), calorimeters ( $\beta$ ), muon systems ( $\beta$ )

Various combinations of subsystems to catch different possible natures of long-lived particles

More details in talk by N Taiblum

# RP violation and long-lived particles

Long-lived gluino  $R$ -hadrons can get stuck in the detector and decay much later

Most recent ATLAS reference (8 TeV): ATLAS-CONF-2013-057

Search for hadronic calorimeter activity in out-of-time LHC collisions (using empty bunches)

Background dominated by beam-halo  
(measured in unpaired bunches) and cosmics  
(measured in low-lumi runs)

Strong model dependence in signal stopping fraction

Stopped gluino candidate in 8 TeV data

A beam-halo candidate event in the unpaired data

A cosmic ray background event passing all selection requirements except for muon segment veto

More details in talk by N Taiblum

# RP violation and long-lived particles

Long-lived gluino  $R$ -hadrons can get stuck in the detector and decay much later

Most recent ATLAS reference (8 TeV): ATLAS-CONF-2013-057

Search for hadronic calorimeter activity in out-of-time LHC collisions (using empty bunches)

Background dominated by beam-halo  
(measured in unpaired bunches) and cosmics  
(measured in low-lumi runs)

Strong model dependence in signal stopping fraction

More details in talk by N Taiblum

# Summary

ATLAS is carrying out a detailed and thorough search for SUSY in the LHC run-1 dataset

We have to complete the job for the 2012 8 TeV data

R & D time during LS1 allows us to:

- Increase coverage for difficult SUSY regions
- Solidify our understanding of SM backgrounds by improving Monte Carlo generator predictions in collaboration with the generator authors, and by further measuring rare background channels
- Prepare for first high energy searches (in particular the trigger strategy must be finalized and validated well before first collisions)

High energy running in 2015 will significantly increase our sensitivity to many SUSY scenarios

- Expect ~x10 for 600 GeV stops, ~x200 for 2 TeV gluinos

Looking forward to the next exciting years!

ATLAS SUSY Searches\* - 95% CL Lower Limits

ATLAS Preliminary

Status: SUSY 2013

# Top physics – differential measurements

Top pairs in association with jets are dominant background for most SUSY searches

ATLAS-CONF-2012-155, see also: 1203.5015

Measurement of fiducial jet multiplicity in  $t\bar{t}$  production (lepton+jets) at 7 TeV ( $4.7 \text{ fb}^{-1}$ )

Rapidity gap fraction<sup>(\*)</sup> measurements vs.  $|y|$  help to assess uncertainties related to ISR/FSR

Variation of  $\alpha_s$  and PS parameters describes ISR/FSR uncertainties

<sup>(\*)</sup>  $Q_0$  is the fraction of events with no additional jet radiated within a considered rapidity interval

# How do we search for SUSY ?

## Triggering the events

We usually use:

MET triggers:  $MET > 120 \text{ GeV}$

single lepton trigger:  $p_T > 25 \text{ GeV}$

multi-object triggers (di-lepton, MET+X, jet+X): lower thresholds

For low- $p_T$  SUSY final states (compressed spectra) can use ISR jets to trigger the event

For long lived searches special dedicated triggers are needed

ISR jet boosts the final state

Triggering on MET difficult with pileup. Trigger improvements allowed a lower MET threshold in 2012 than 2011!
