XMASS Projects

Hiroyuki Sekiya

ICRR & Kavli-IPMU, University of Tokyo

for the XMASS Collaboration

Aug. 29 2013

21st International Conference on Supersymmetry and Unification of Fundamental Interactions (SUSY2013)

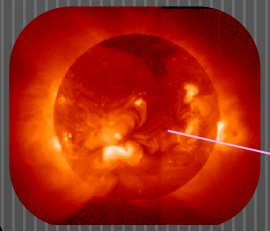
Contents

- Introduction
- Recent physics results
  - From 2012 commissioning run
  - Light WIMP search **Phys. Lett. B719 (2013) 78**
  - Solar axion search **Phys. Lett. B724 (2013) 46**
- Current status
  - Detector refurbishment
- Future prospects
  - XMASS-1.5

XMASS Projects…

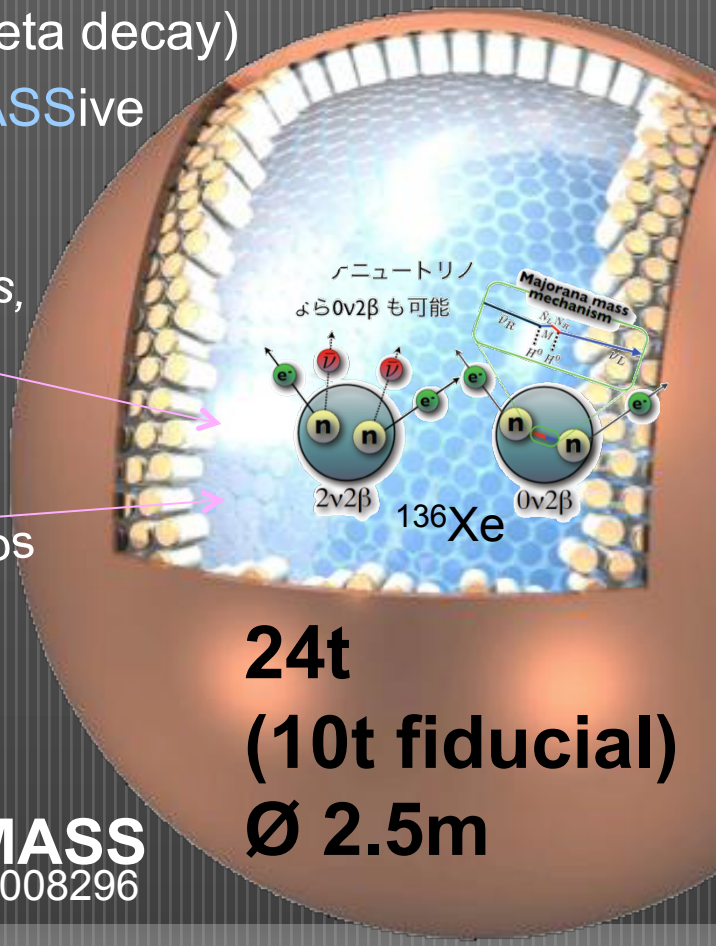
Multipurpose low BG experiment with single phase (liquid) Xe

- Xenon MASSive detector for Solar neutrino (pp/^{7}Be)
- Xenon neutrino MASS detector (double beta decay)
- Xenon detector for Weakly Interacting MASSive Particles(DM)



neutrinos, axions

dark matters, neutrinos



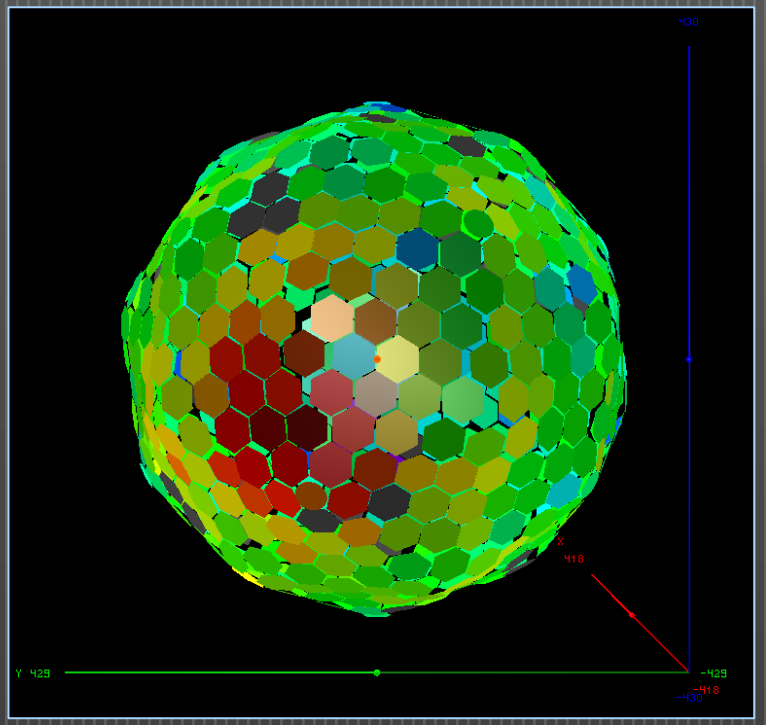
24t
(10t fiducial)
Ø 2.5m

The ultimate XMASS
Y. Suzuki, hep-ph/0008296

XMASS-1

- 835kg LXe detector for Dark Matter search

80cm



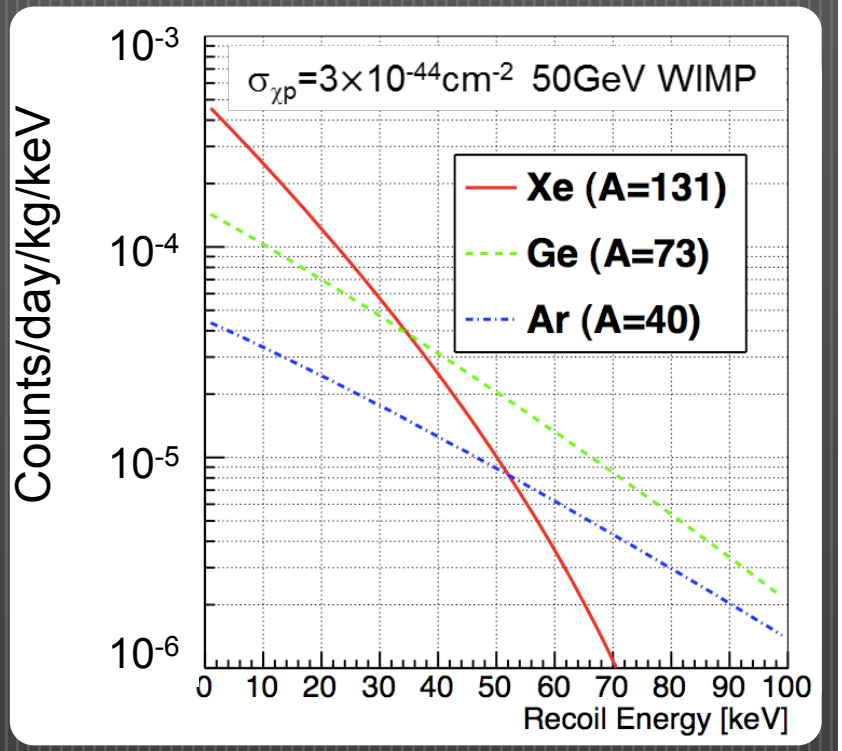
Why Single Phase Xe?
Simple and Clean for Large Scalability

Simplicity
- Single phase LXe scintillator
- Simple structure like Super-K

Cleanliness
- Made of pure materials
  - Development of low BG PMTs
- Xe purification technologies
  - distillation system

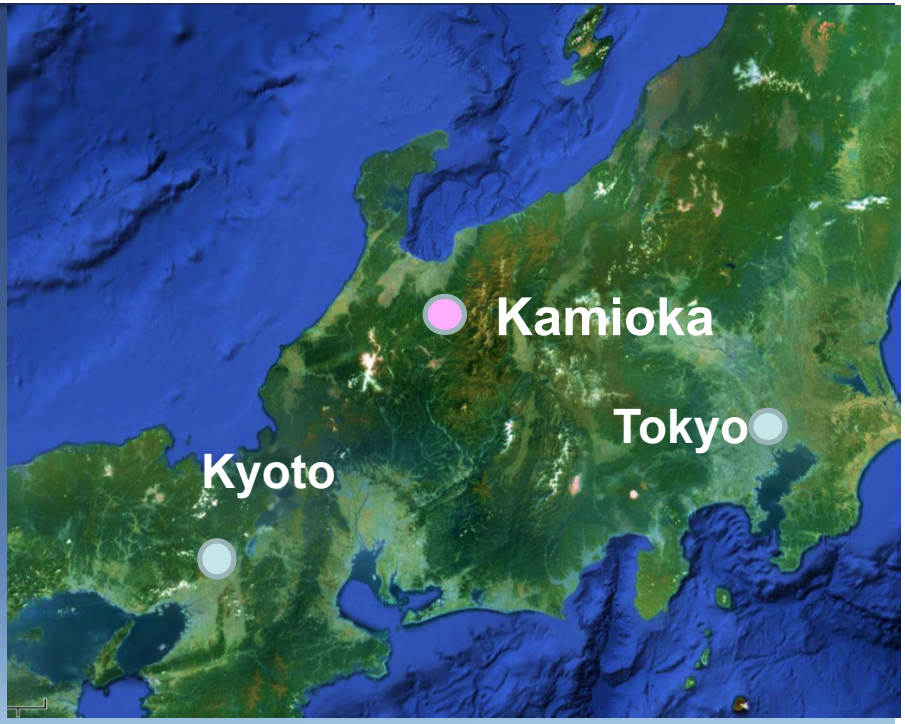
Xe has the advantage for Spin Independent interacting WIMPs

Expected WIMP spectrum



Kamioka Observatory

- Located underground in Mozumi zinc mine at a 2700 m.w.e. depth.
- 2km horizontal access by cars



Mt. Ikenoyama

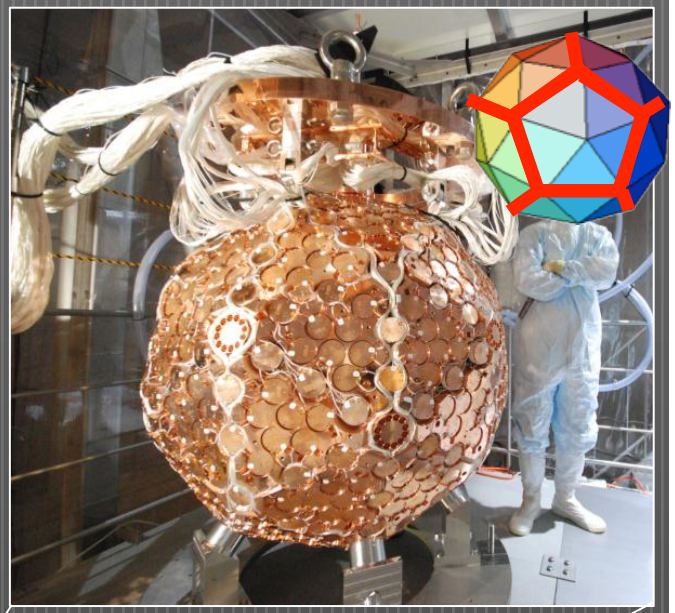
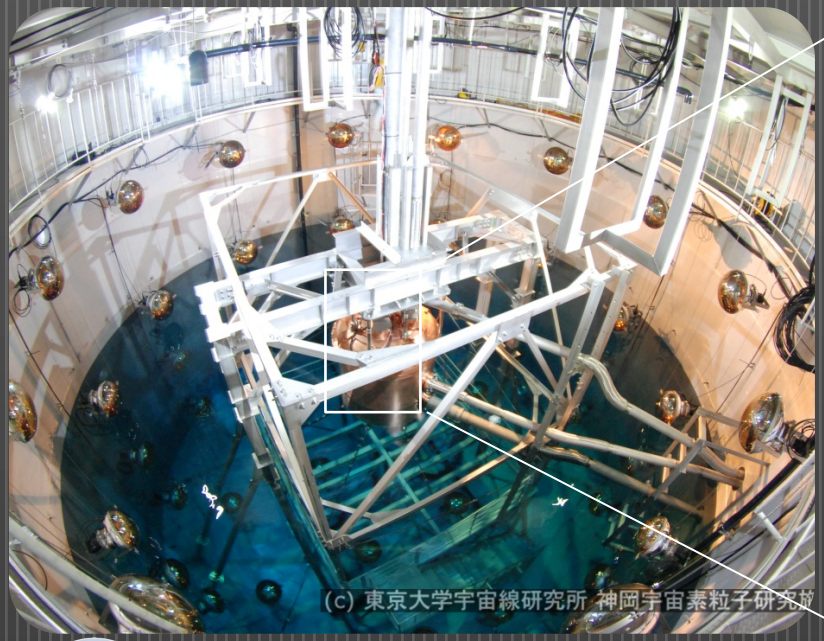
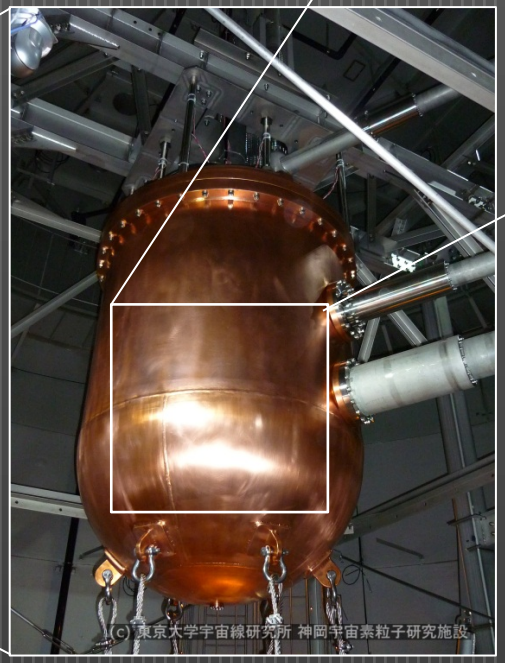
XMASS-1 Detector

- 10m x ϕ10m water shield for external BG
- 1050 kg Liquid Xe within the chamber.
  - Largest mass among DM detectors
- 642 hexagonal PMTs on
  80cm pentakisdodecahedron







Construction was completed in Oct 2010

Inside of the pentakisdodecahedron

- Photo coverage is 62.4%

Clean PMT

HAMAMATSU

XMASS PMT HISTORY

YEAR	2000	2002	2009
Model	Prototype	R8778	R10789
Material:Body	glass	Kovar	Kovar
QE	25%	25%	**27-39%**
RI:			w/ PMT base
U [mBq/PMT]	*50*	*18±2*	*0.70±0.28*
Th [mBq/PMT]	*13*	*6.9±1.3*	*1.51±0.31*
^{40}K [mBq/PMT]	*610*	*140±20*	*9.10±2.15*
^{60}Co [mBq/PMT]	*<1.8*	*5.5±0.9*	*2.92±1.61*

- Clean PMT Base has also been developed.

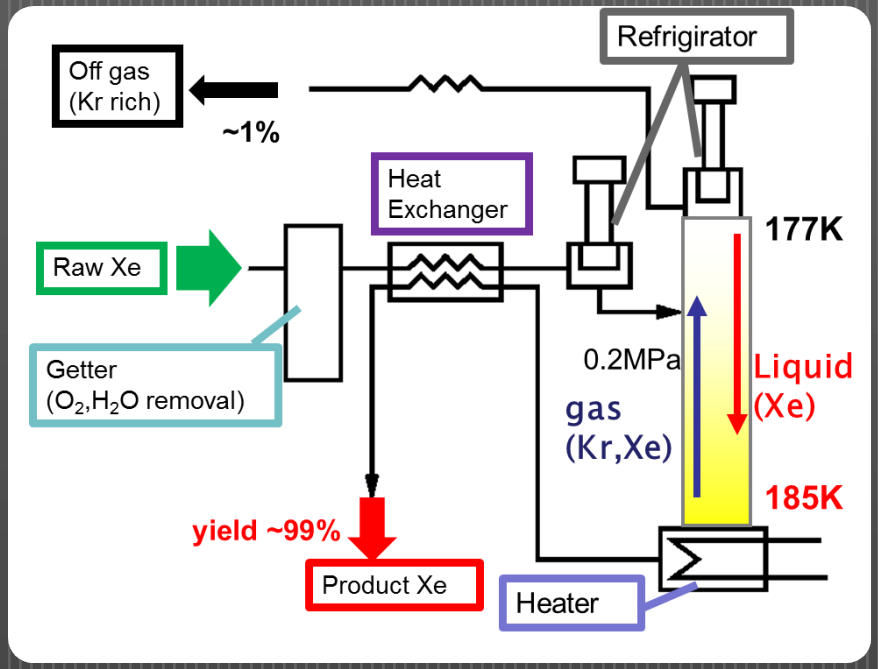
Astoparticle Physics 31, (2009) 290

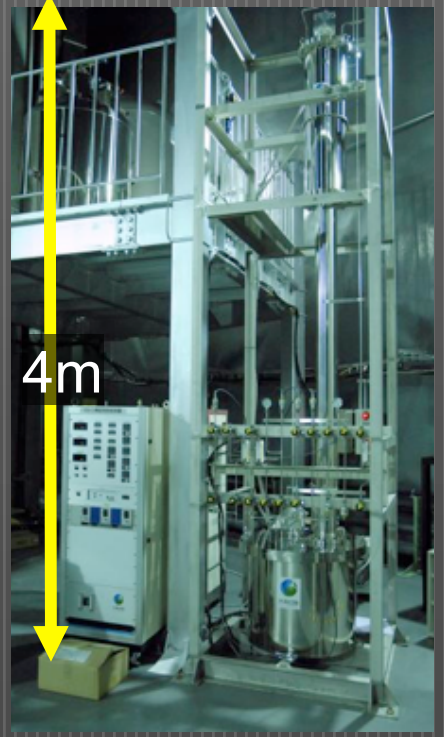
Xe Distillation System

- Commercial "pure Xe" contains ~0.1ppm Kr
  - ^{85}K / K = 1.2×10^{-11} τ =10.8 year, Q_β = 687keV
  - 5 order reduction was indispensable.

	Boiling point (@0.2MPa)
Xe	178K
Kr	140K~150K

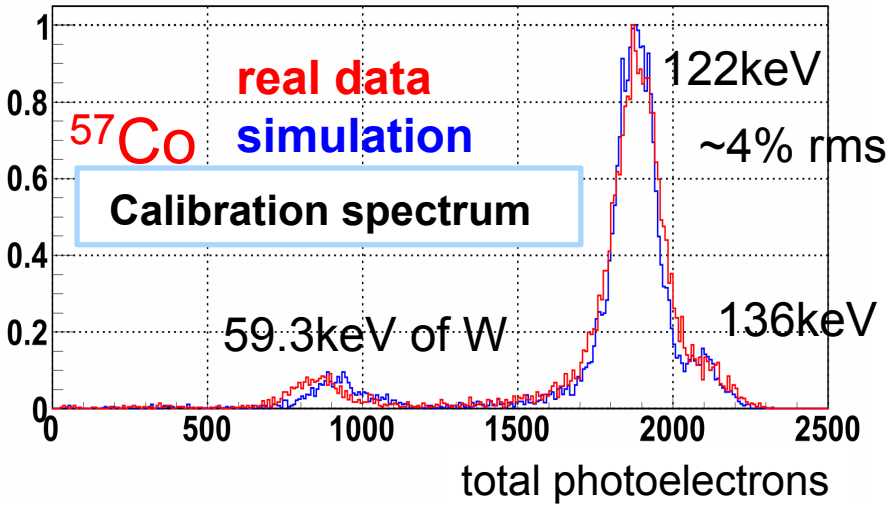
We established Xe purifiaction by distillation

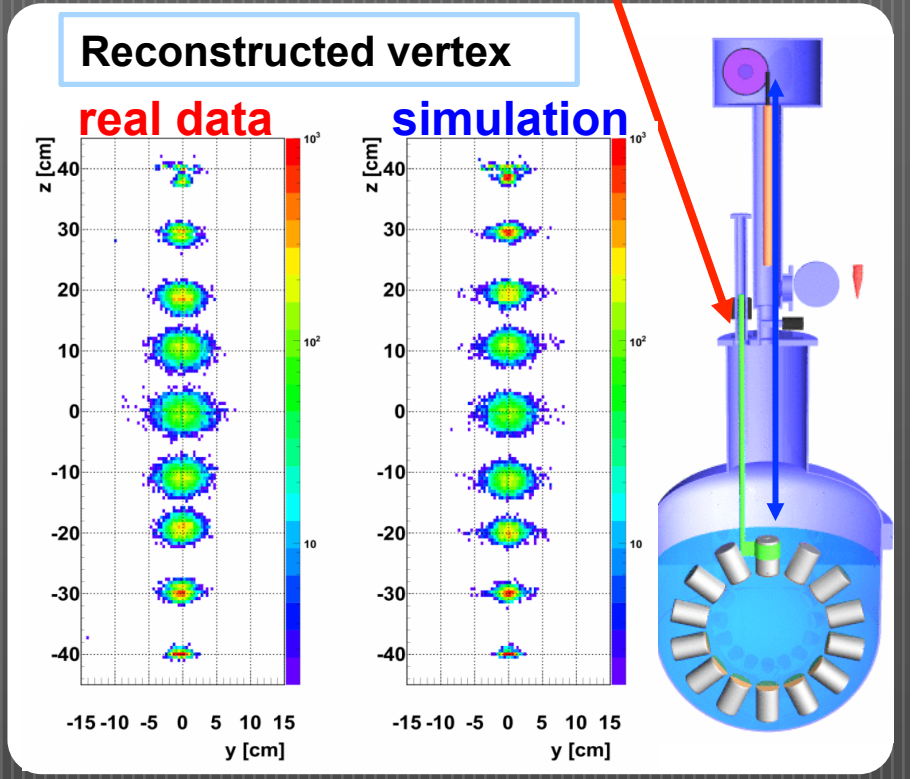


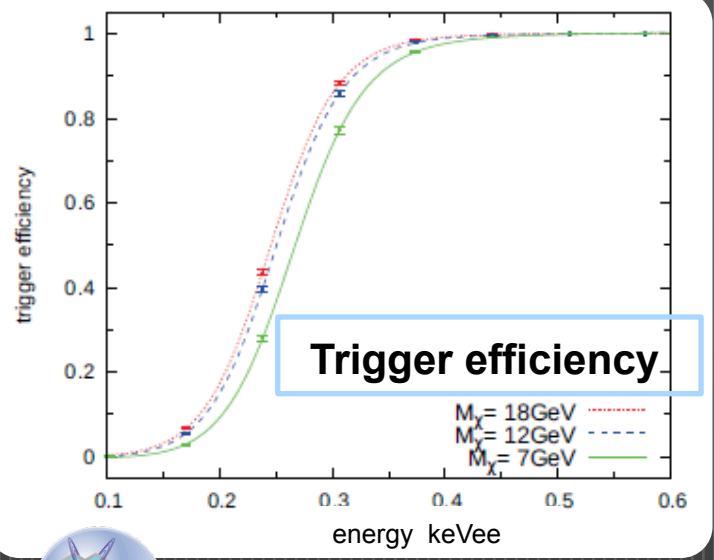


- 1 ton LXe = 170 m^3 gas Xe Process speed: 4.7kg/hr → 10 days
- Confirmed Kr < 2.7ppt by API-MS

Detector Response



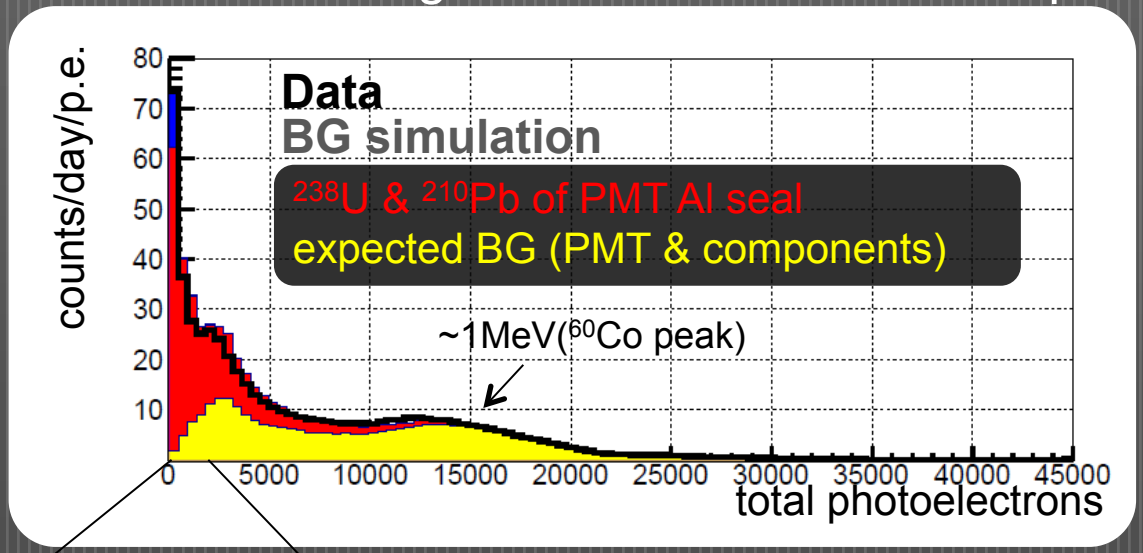


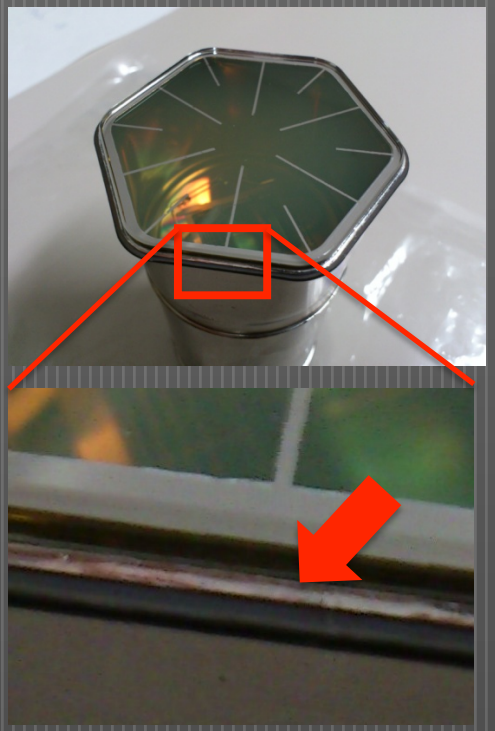


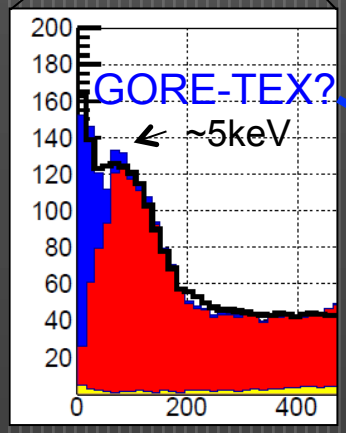
- Highest LXe scintillation yields: 14.7p.e./keVee
- Lowest threshold: 4hits→0.3keVee

Unexpected BG

- BG is 2 order higher than that had been expected.



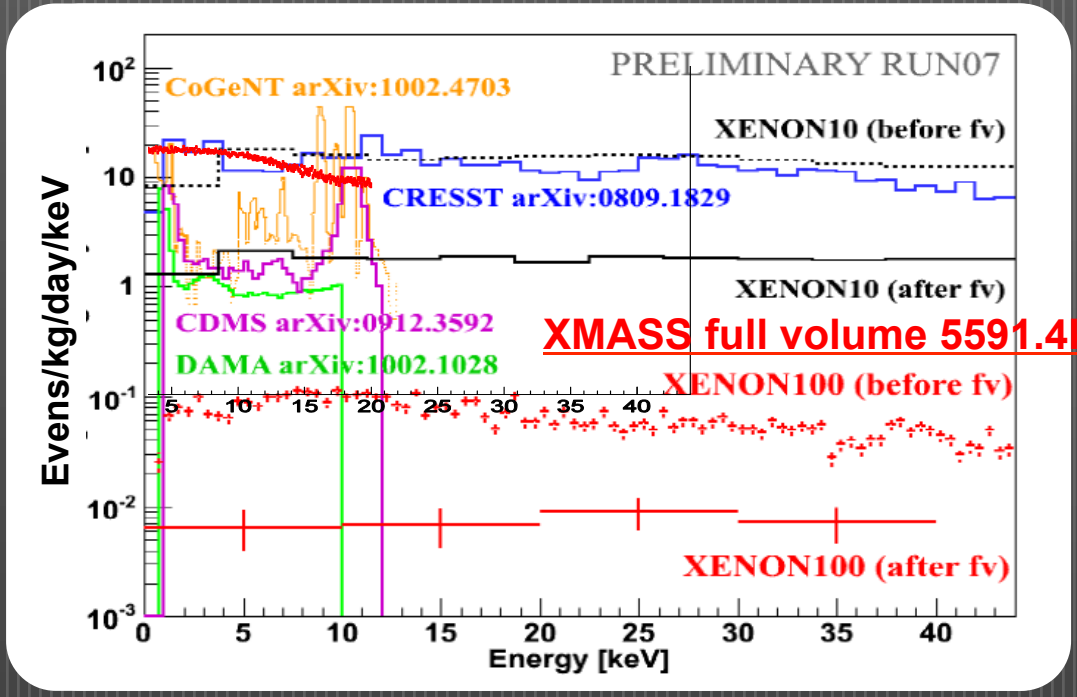




- Major origin of BG was considered to be γ from PMTs, but the observed data seemed to have additional surface contamination.
  - Aluminum sealing parts for the PMT (btw metal body and quartz glass) contains ^{238}U and ^{210}Pb (>5keV)
  - GORE-TEX between PMT and holder is suspicious below 5keV.

XMASS Full Volume: Low BG w/o PID

- Although extra BG sources were found, XMASS BG level is still competitive w/o rejecting electronic events.
  - XMASS has a competitive sensitivity to Light WIMPs & Axions



E. Aprile, 2010 Princeton

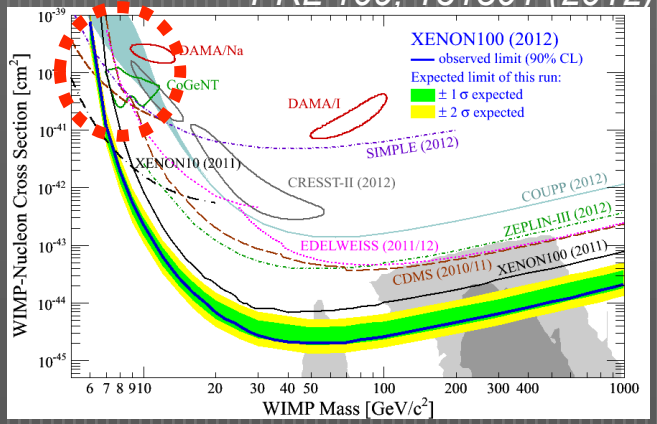
- Fiducial volume analyses are on-going and will be released.

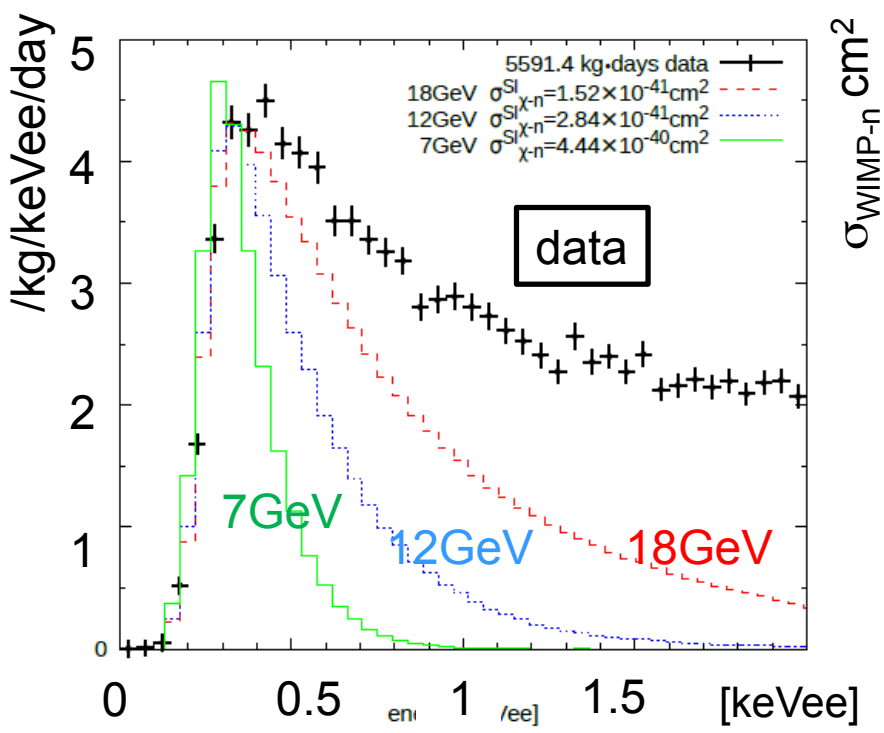
Phys. Lett. B719 (2013) 78

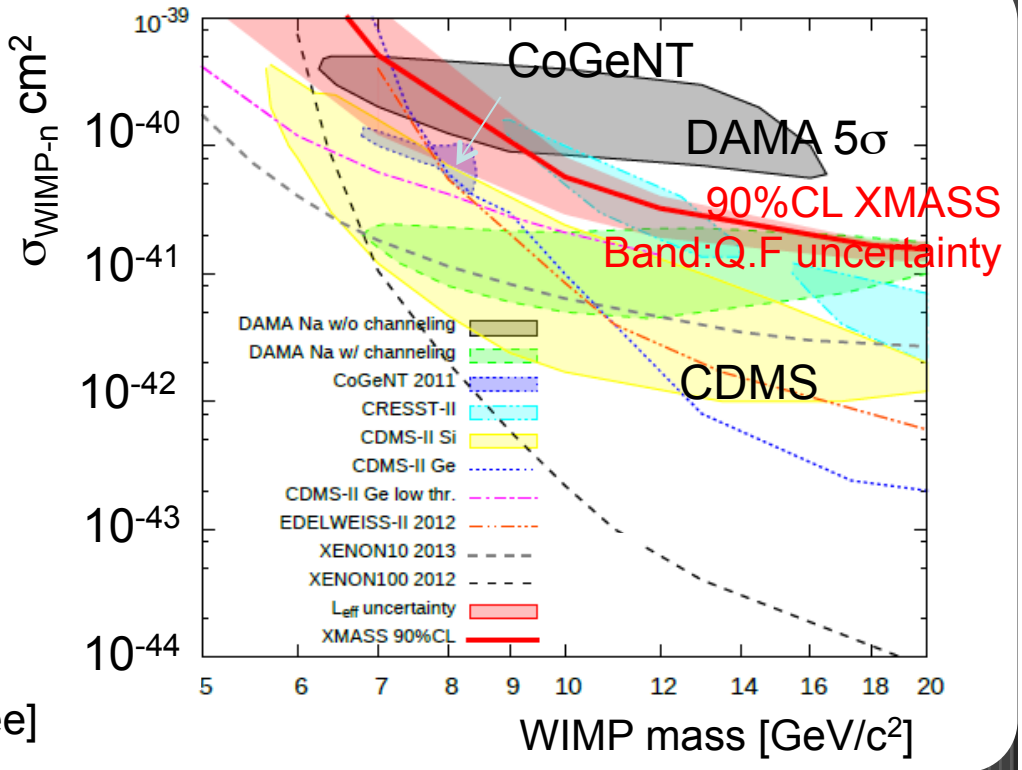
PRL 109, 181301 (2012)

Light WIMPs

- Set an upper limit on the WIMP-nucleon cross section for WIMPs with masses below 20GeV w/o PID and excludes part of the parameter space allowed by DAMA



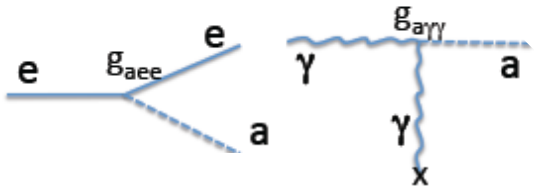


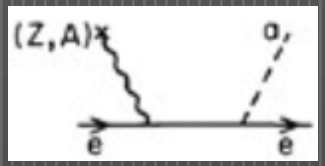


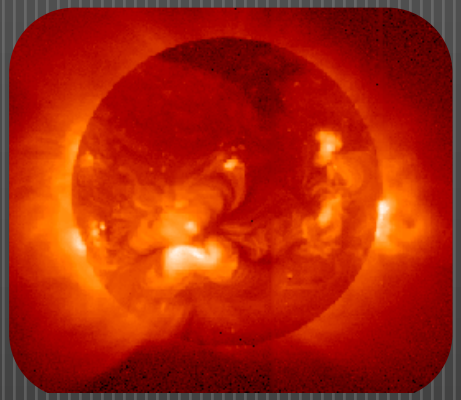
Solar Axions

JETP Lett., 95, 379 (2012)
A. V. Derbin et al.,arXiv:1206.4142

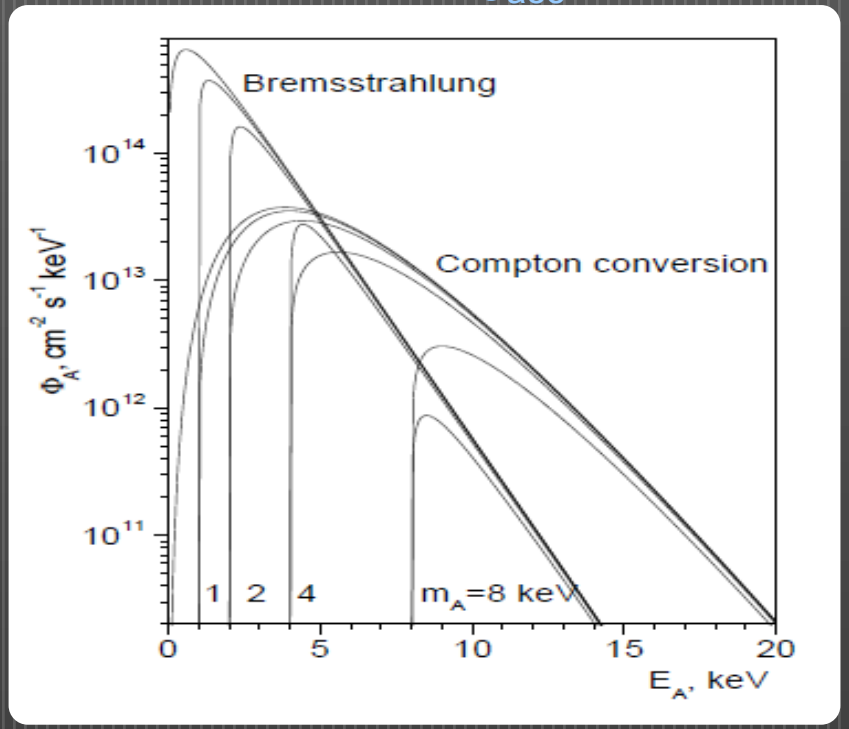
- XMASS has also sensitivity to solar axions that would be produced by Bremsstrahlung and Compton effects (g_{aee}) in the Sun through the axio-electric effect in Xe
  N.B. Not $g_{a\gamma\gamma}$ through Primakoff effect







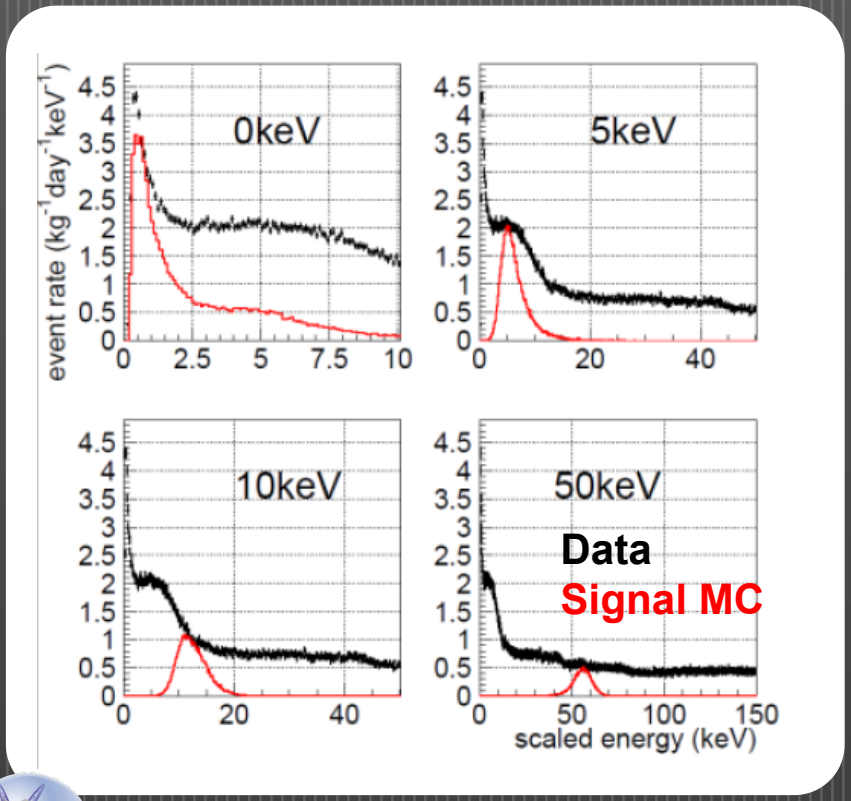
Expected flux $g_{aee}=10^{-10}$.

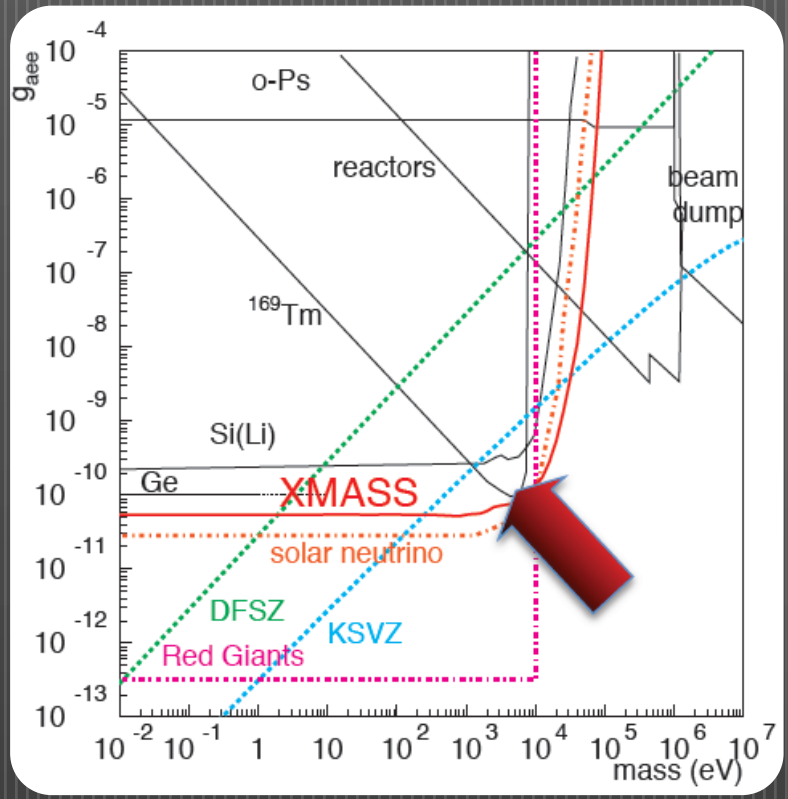


Phys. Lett. B724 (2013) 46

Solar Axions

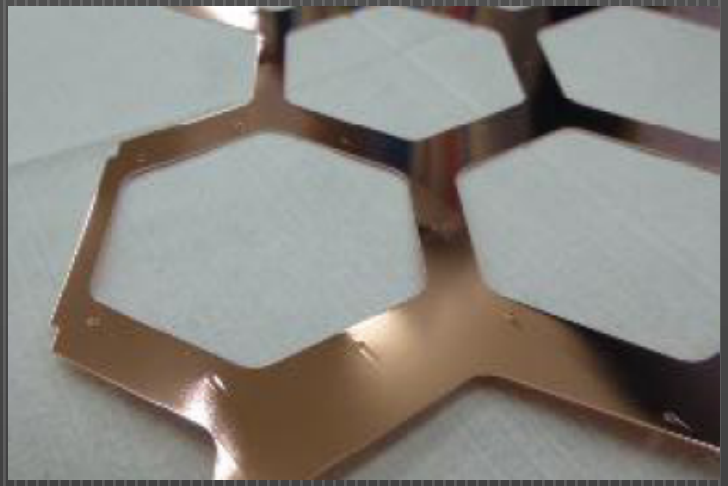
- Same data set as Light WIMP search
- No indication of signals. Bound in gaee vs. mass.
- Better than any other constraint in 10-40keV.
- Better than any other experimental constraint





XMASS-1 Refurbishment
for Background reduction

- Countermeasures
  - PMT+Cu surface cleanup
  - Remove GORE-TEX
  - Cover PMT Aluminum seal
    - Cu ring around aluminum seal
    - Electropolished Cu cover above Cu rings



After Cu ring attachment

After thin Cu plate attachment

Almost finished

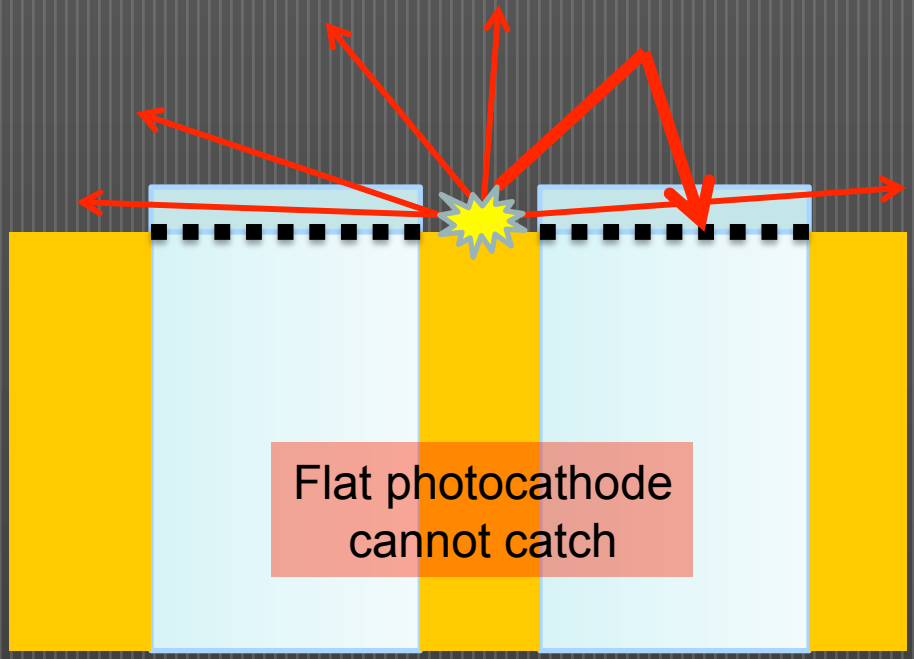
- Will resume data taking in this autumn.

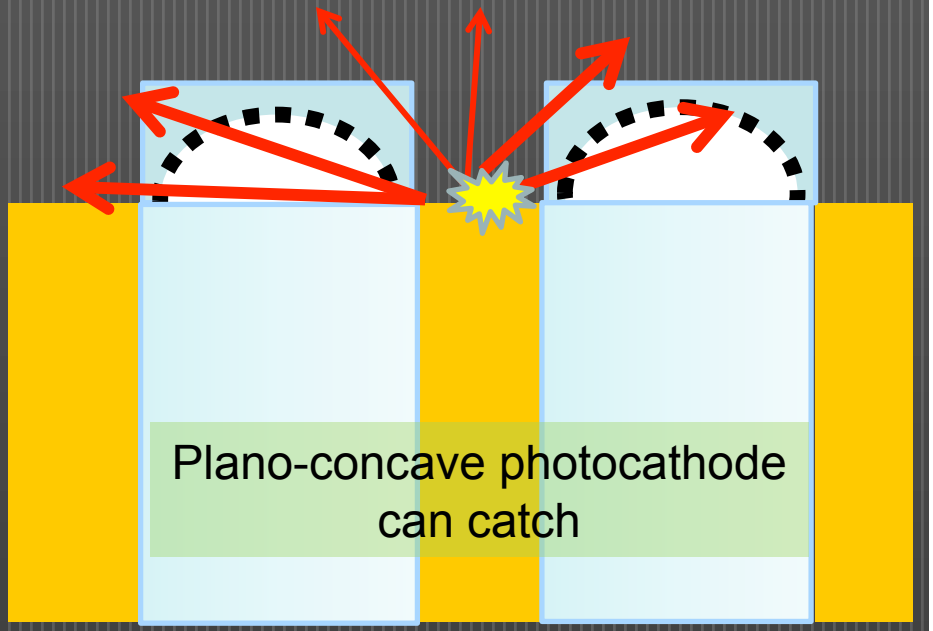
Next step: XMASS-1.5

- Inner Ø: 1.5 m
  - contains 5 tons of LXe
  - fiducial mass 1 ton
- Lessons from XMASS-1

Still Dark matter detector

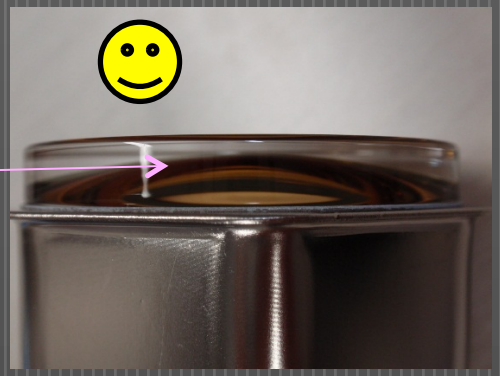
New PMT



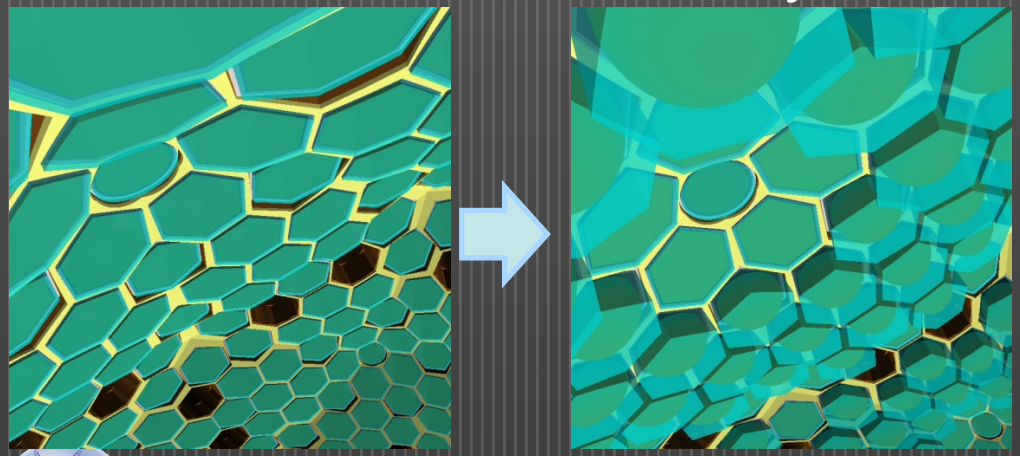


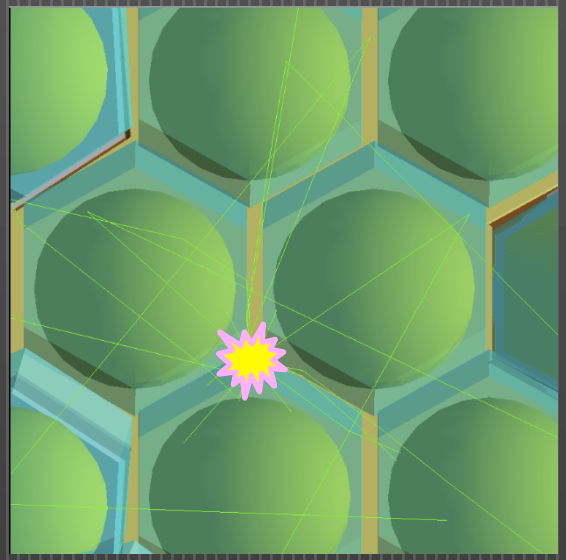
XMASS-1.5

- Actively being developed w/ Hamamatsu



- Effectiveness is verified by MC



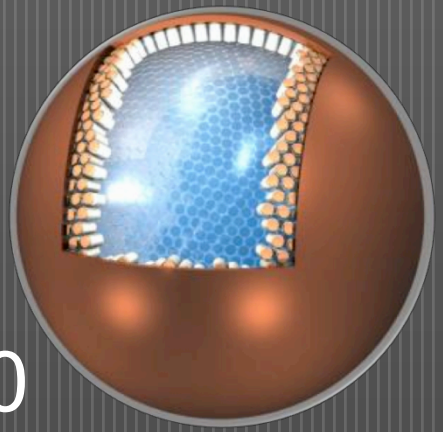


XMASS projects and timeline

XMASS-1-RFB

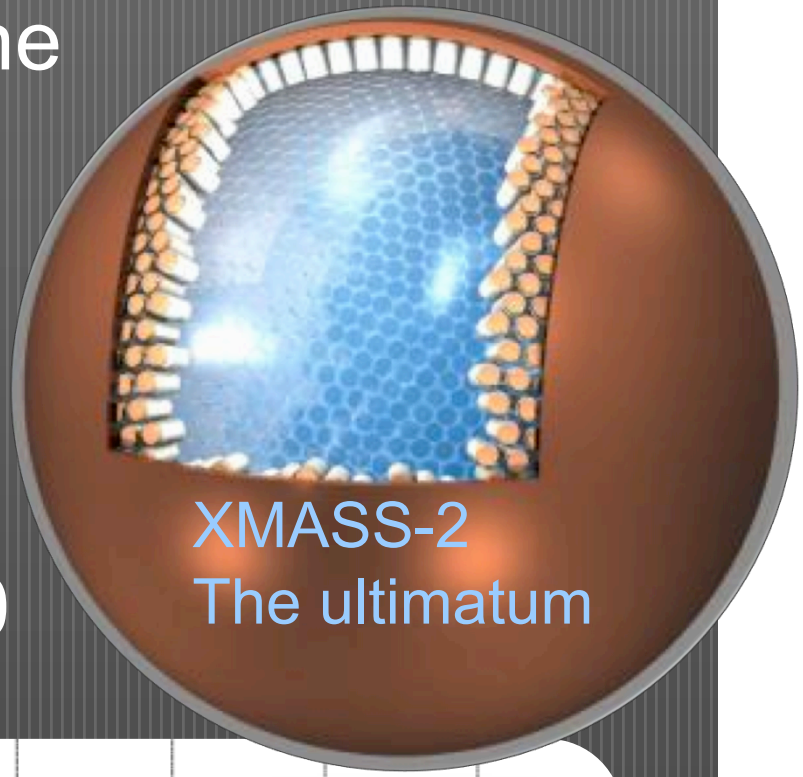
x10

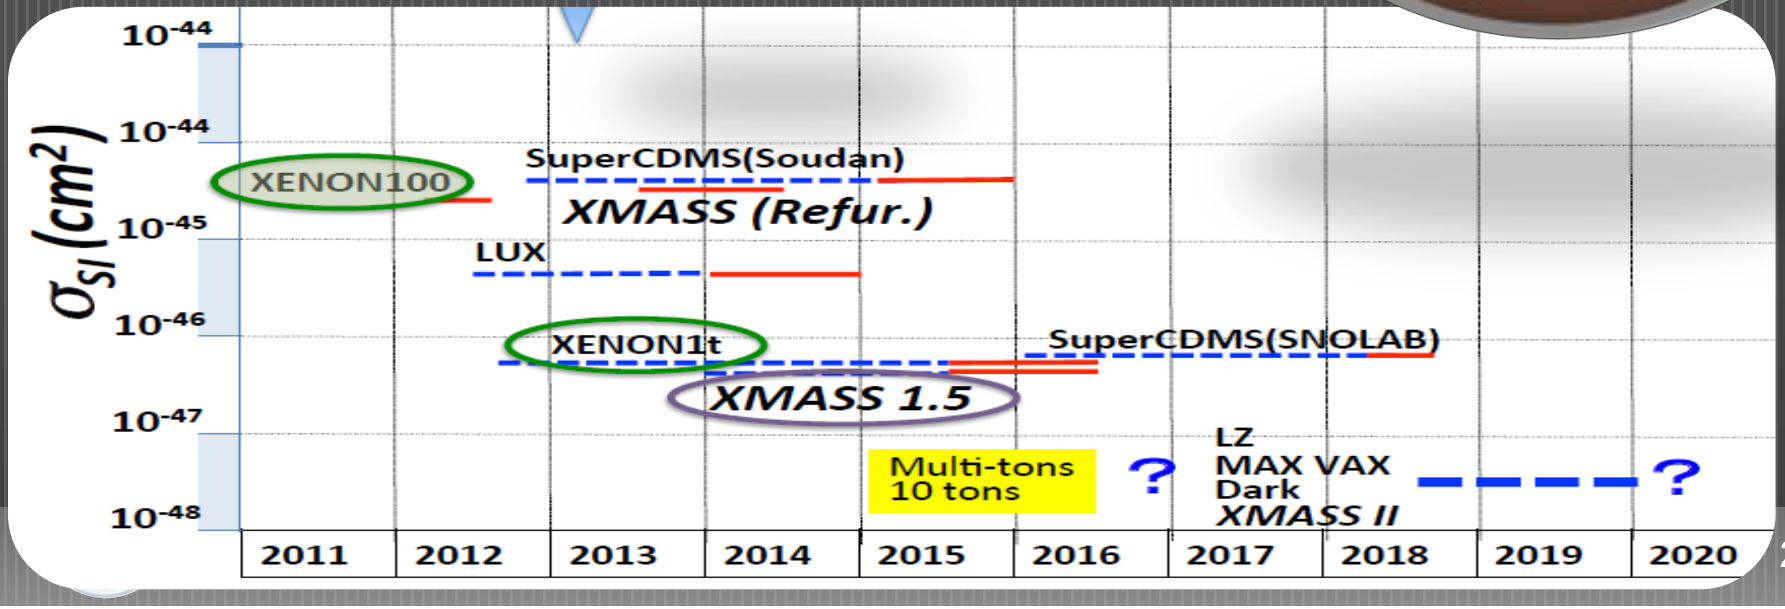
XMASS-1.5



x10

XMASS-2
The ultimatum





Conclusion

- XMASS-1 obtained light WIMP and solar axion result by using 835kg of LXe with very low threshold (0.3keVee)

  Phys. Lett B 719(2013)78, Phys. Lett B 724 (2013) 46

- Initial contamination problems are understood and being addressed.
  - The refurbishment of XMASS-1 is on-going and data taking will resume soon.
- XMASS-1.5 is planned and the projects move on.

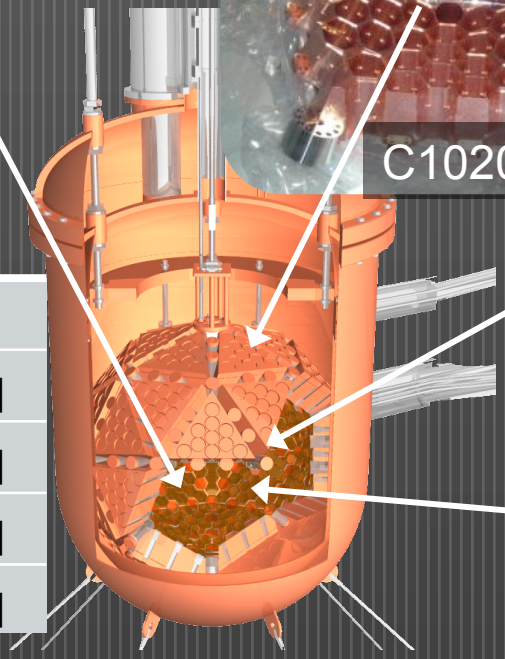
Pure components

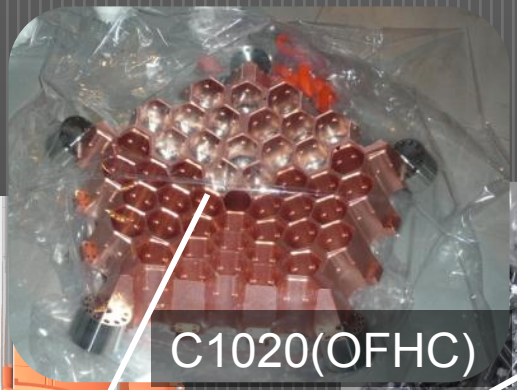
- More than 250 components

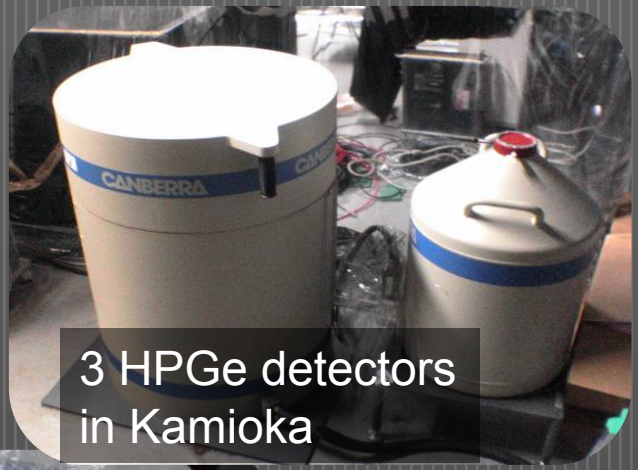
  RIs of all the components were measured with HPGe and low RI materials were selected.

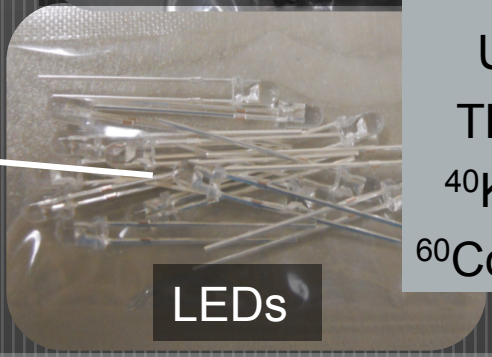
PMT(R10789)

RI:	/one PMT
U	*0.70±0.28* mBq
Th	*1.51±0.31* mBq
^{40}K	*9.10±2.15* mBq
^{60}Co	*2.92±1.61* mBq









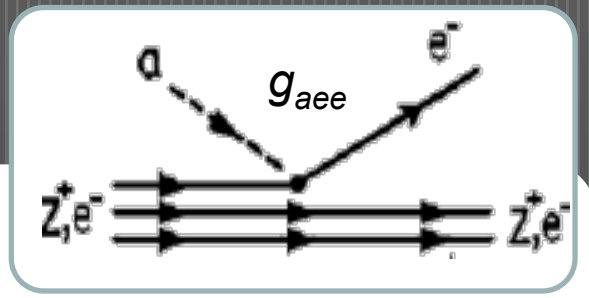
Sum of other components	
RI:	Compared w/ 642 PMTs
U	<35%
Th	<35%
^{40}K	<20%
^{60}Co	<20%

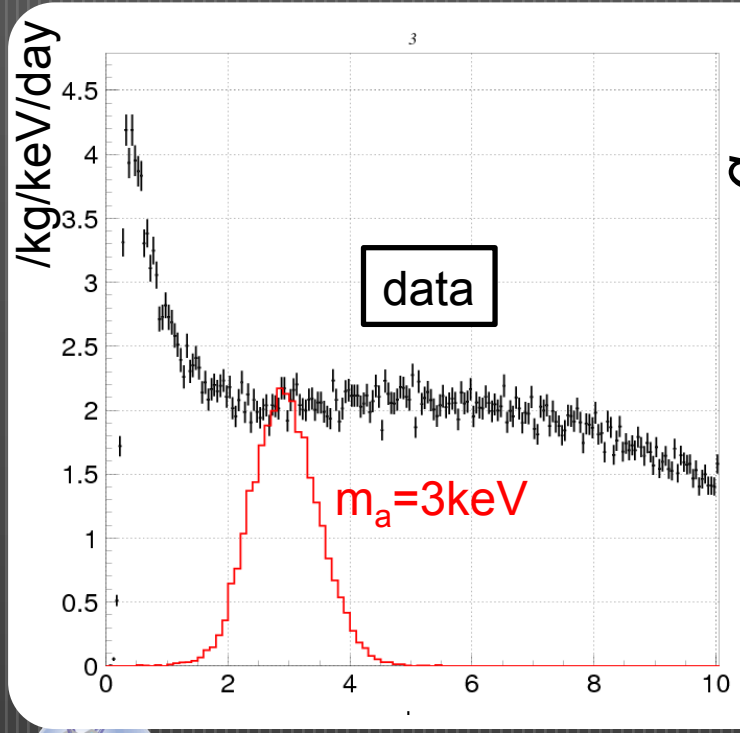
Dark Matter Axion

- DAMA signal can be explained by electromagnetic interactions of non-relativistic Axions and NaI.

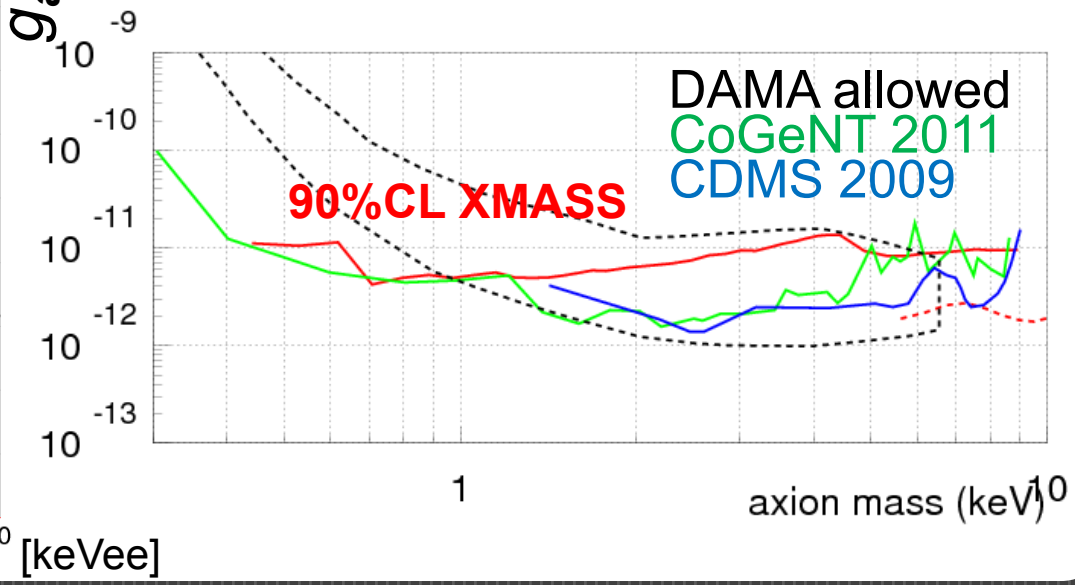
  [J. Collar, arXiv: 0903.5068]

- XMASS has sensitivity to dark matter Axion through Axio-electric effect.



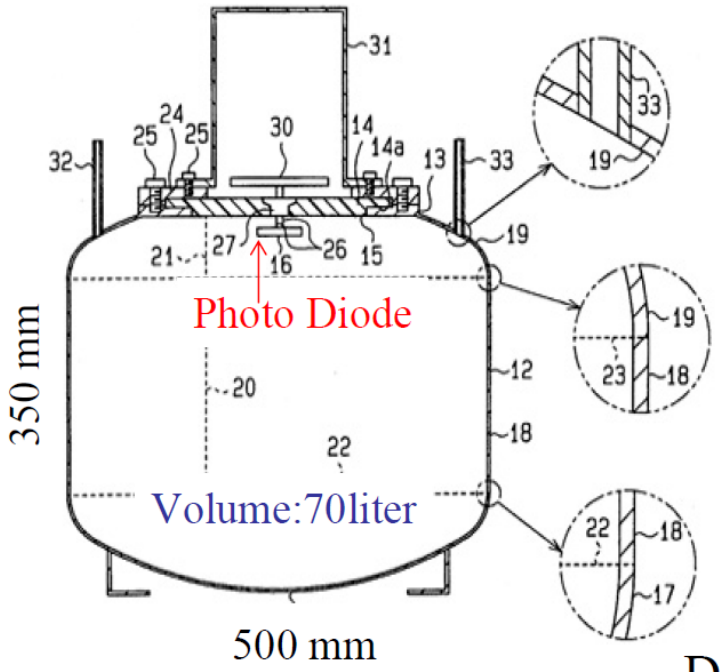


Limits on g_{aee}



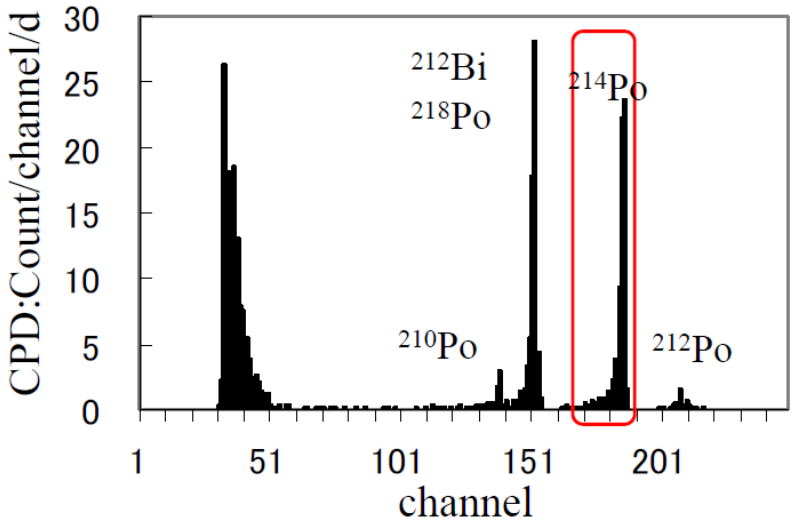
Rn

Electrostatic collection Radon Detector



- Sensor : PIN Photo-Diode
  α-rays energy separation
- Electro-polished stainless steel
- Electrostatic Voltage -2kV
- Detection Limits 5(mBq/m^3)

Typical Pulse high distribution
2009/11/30-2009/12/11



Detector Calibration by Source
^{226}Ra(PYLON 78.3Bq)
CF=1.93±0.01[CPD/(mBq/m^3)]
Absolute Humidity=0.011(g/m^3)
CF=2.03-1.08*SQRT(AH), AH<1.6g/m^3

Quenching Factor/Leff uncertainty

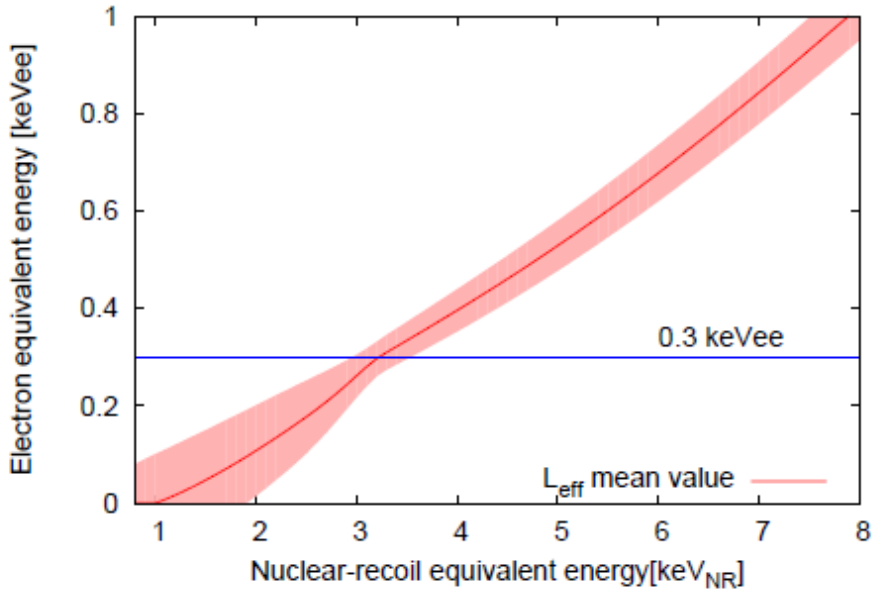


Figure 1: The relationship between the electron equivalent energy and the nuclear-recoil equivalent energy based on the $\mathcal{L}_{\text{eff}}$ method of Ref. [14]. The one-σ uncertainty and the 0.3 keVee analysis threshold are also shown.

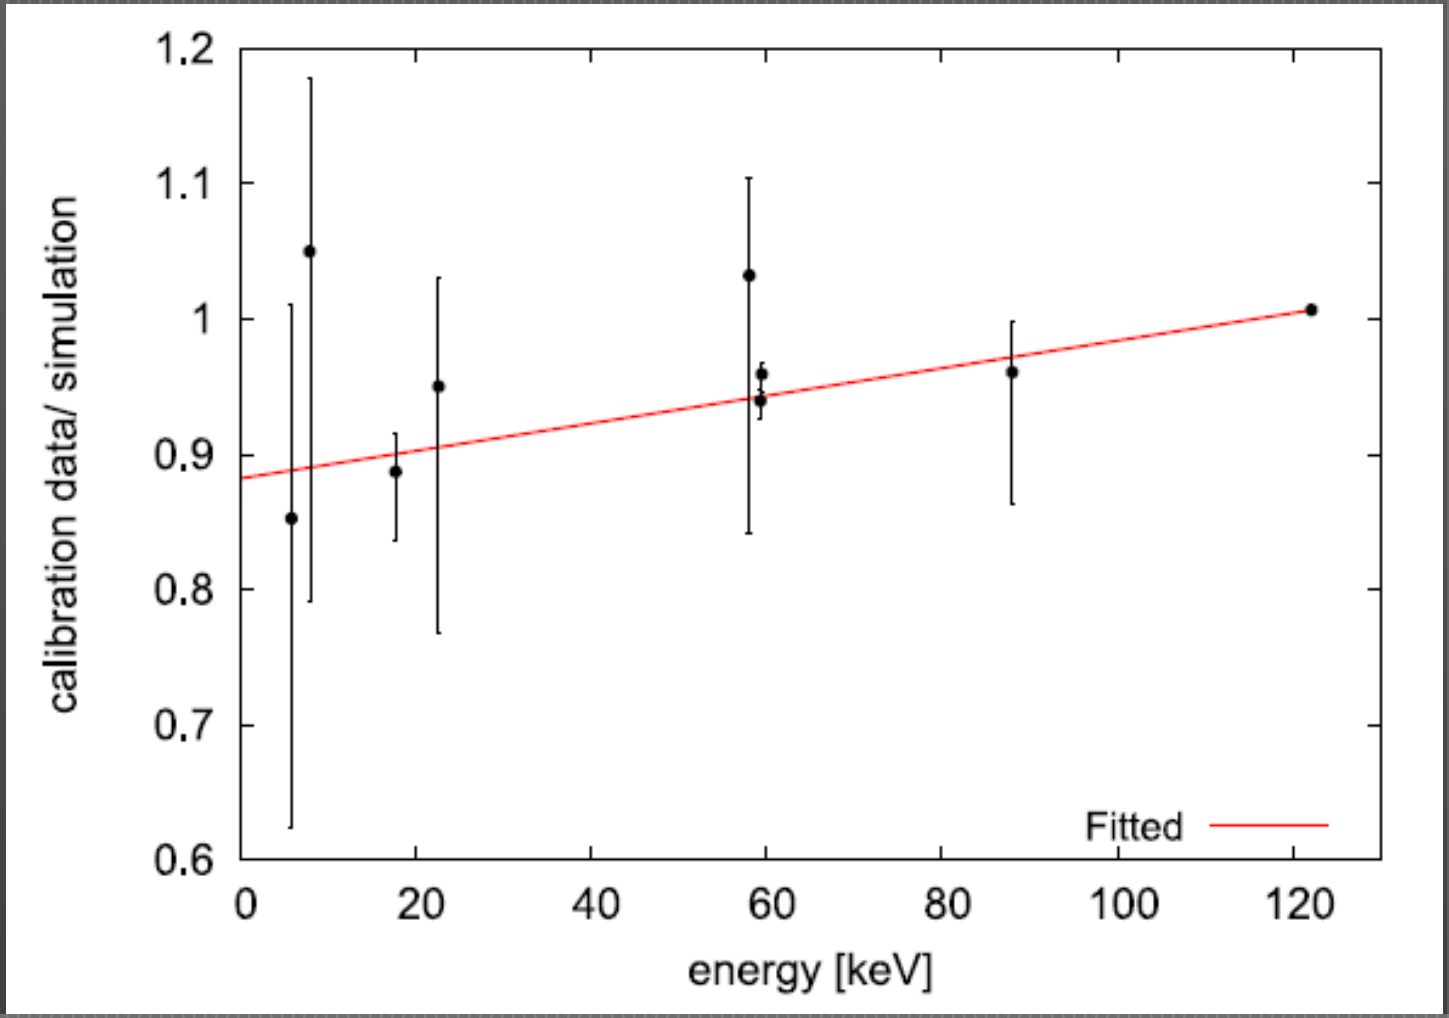
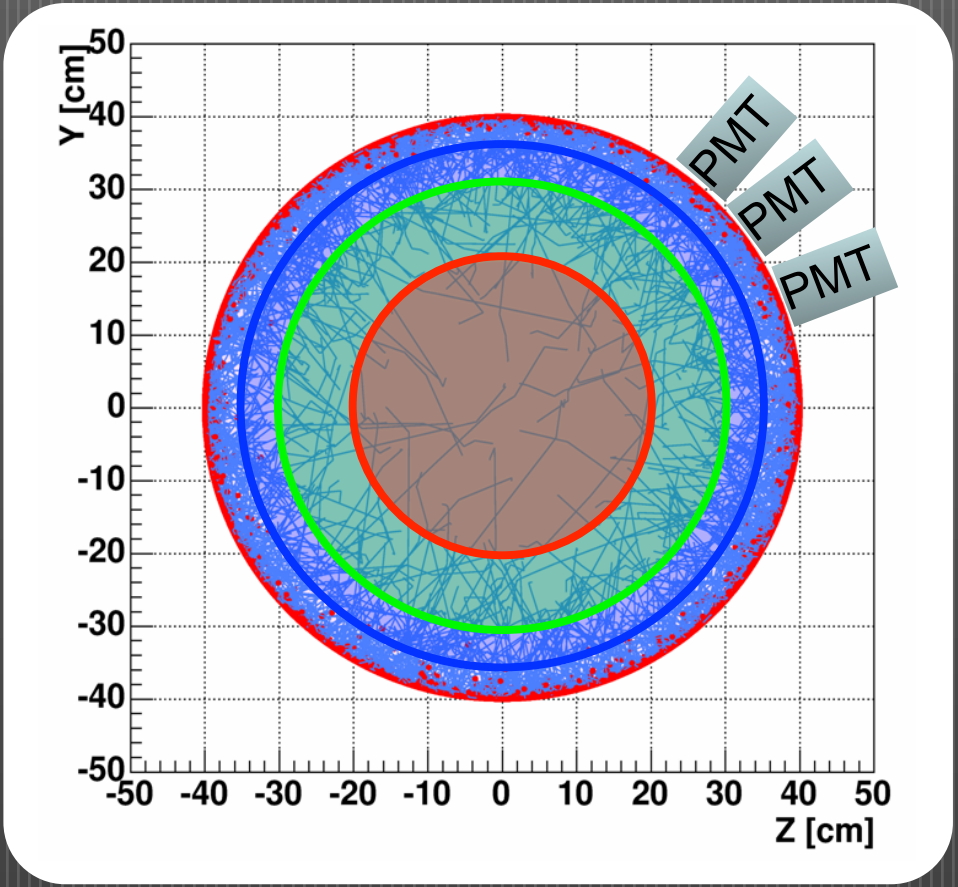
Energy scale calibration



Self-shielding for detector material BG

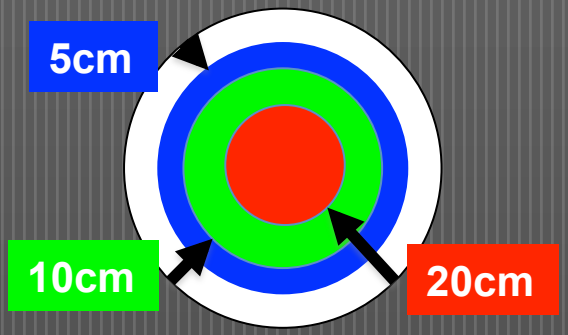
- High density Xe itself is the shield for γ,n from PMT/OFHC/…



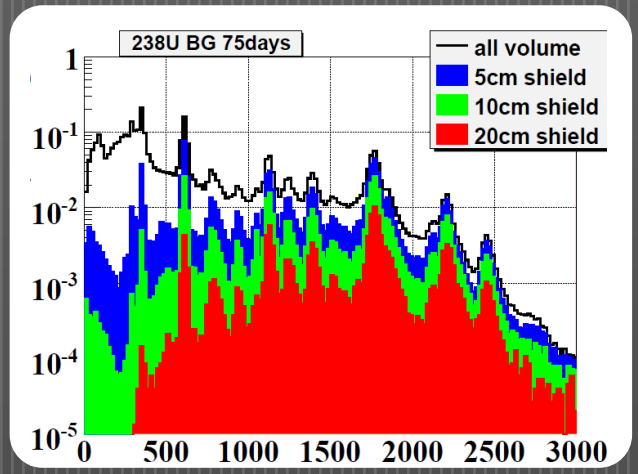
Thicker shield makes lower BG region in center

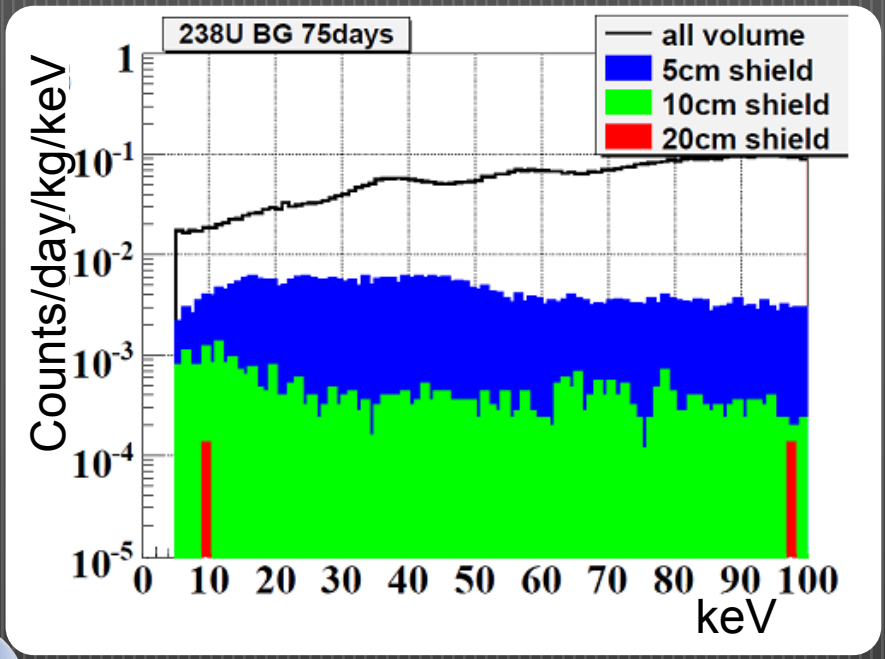
Original expectation

Ex.) Most dirty component : PMT ^{238}U Chain 1.8mBq/PMT



Full MC,
assuming abs.
100cm, scat. 30cm
for photon tracking





20cm Xe is used for shield

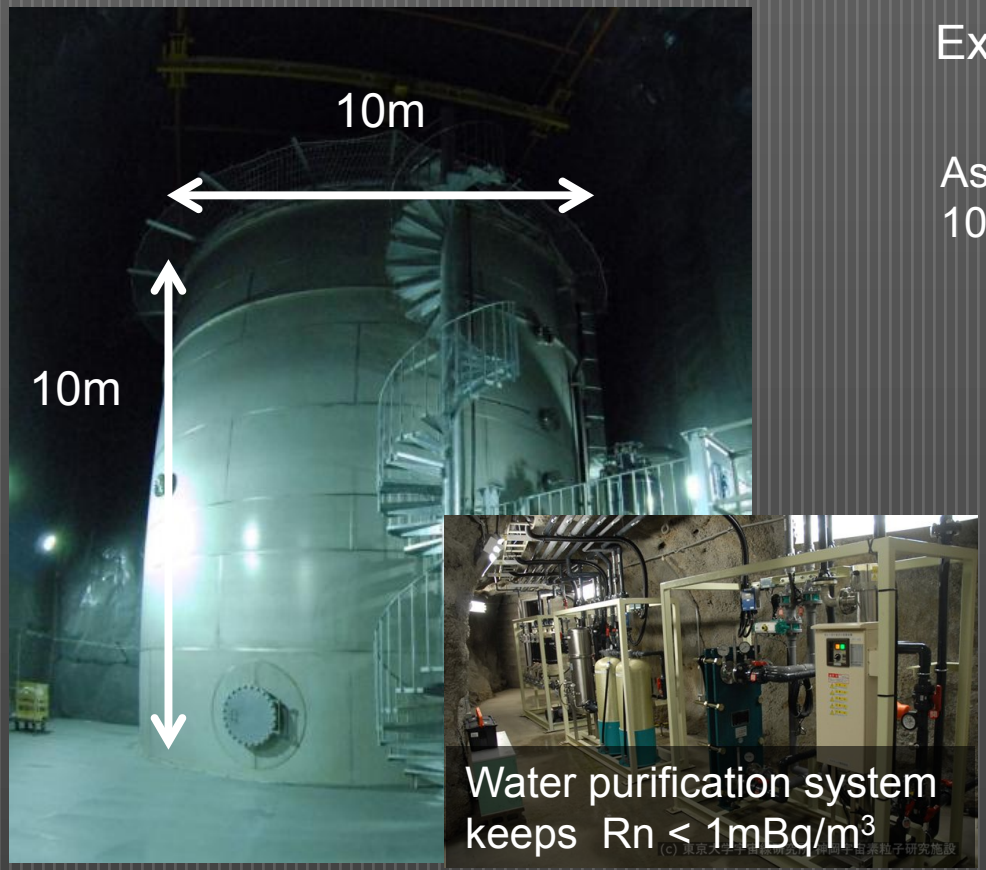
Water shields for external BG

- Active for μ, passive for γ,n

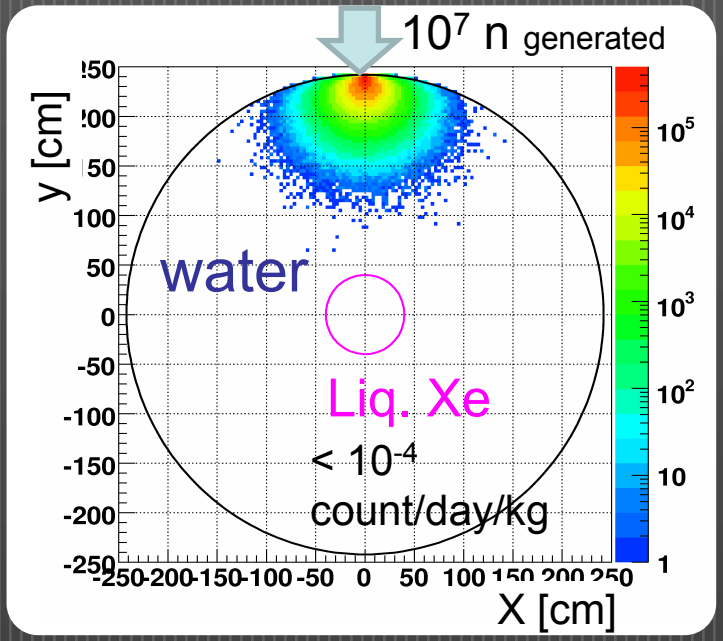


Water purification system keeps Rn < 1mBq/m^3

with 70 PMTs (20 inch) to detect Cerenkov light

Ex.) Fast n flux @Kamioka mine:
(1.15+0.12) x10^{-5} /cm^2/sec

Assuming all neutron's energies are 10 MeV very conservatively



5m tank is enough large to shield n and γ
